Package 'RemixAutoML'

March 18, 2019

Title Automated Machine Learning

Version 1.0

Description Automate and ensure high quality output for most of your machine learning and data science tasks. We have high quality functions that run at efficient speed with minimal memory constraints. The library contains functions for supervised learning, unsupervised learning, feature engineering, model evaluation and interpretation, along with some helper functions for graphing.

Depends R (¿= 3.5),

ystemRequirements Java (¿= 7)

License GPL-2

`AutoH20Modeler` *An Automated Machine Learning Framework using H20*

Description

1. Logic: Error checking in the modeling arguments from your Construction file 2. ML: Build grid-tuned models and baseline models for comparison and checks which one performs better on validation data 3. Evaluation: Collects the performance metrics for both 4. Evaluation: Generates calibration plots (and boxplots for regression) for the winning model 5. Evaluation: Generates partial dependence calibration plots (and boxplots for regression)

for the winning model 6. Evaluation: Generates variable importance tables and a table of non-important features 7. Production: Creates a storage file containing: model name, model path, grid tune performance, baseline performance, and threshold (if classification) and stores that file in your model_path location

Usage

```
AutoH20Modeler(Construct, max_memory, ratios, BL_Trees, nthreads,
  model_path, MaxRuntimeSeconds = 3600, MaxModels = 30,
  TrainData = NULL, TestData = NULL)
```

Arguments

Construct	Core instruction file for automation
max_memory	The ceiling amount of memory H20 will utilize
ratios	The percentage of train samples from source data (remainder goes to validation set)
BL_Trees	The number of trees to build in baseline GBM or RandomForest
nthreads	Set the number of threads to run function
model_path	Directory path for where you want your models saved
MaxRuntimeSeconds	Number of seconds of run time for grid tuning
MaxModels	Number of models you'd like to have returned
TrainData	Set to NULL or supply a data.table for training data
TestData	Set to NULL or supply a data.table for validation data

Value

Returns saved models, corrected Construct file, variable importance tables, evaluation and partial dependence calibration plots, model performance measure, etc.

## End(Not run)
```

`AutoTS` *AutoTS is an automated time series modeling function*

Description

AutoTS builds the best time series models for each type, compares all types, selects the winner, and generate forecasts.

Usage

```
AutoTS(data, TargetName = "Targets", DateName = "DateTime",
  FCPeriods = 30, HoldOutPeriods = 30, TimeUnit = "day", Lags = 25,
  SLags = 2, NumCores = 4, SkipModels = NULL, StepWise = TRUE)
```

Arguments

`data`	is the source time series data.table
`TargetName`	is the name of the dependent variable in your data.table
`DateName`	is the name of the date column in your data.table
`FCPeriods`	is the number of periods into the future you wish to forecast
`HoldOutPeriods`	is the number of periods to use for validation testing
`TimeUnit`	is the level of aggregation your dataset comes in
`Lags`	is the number of lags you wish to test in various models (same with moving averages)

SLags	is the number of seasonal lags you wish to test in various models (same with moving averages)
NumCores	is the number of cores available on your computer
SkipModels	Don't run specified models - e.g. exclude all models c("ARFIMA","ARIMA","ETS","NNET"
StepWise	Set to TRUE to have ARIMA and ARFIMA run a stepwise selection process. Otherwise, all models will be generated in parallel execution, but still run much slower.

Value

If Ensemble is TRUE, return a data.table object with a date column and the forecasts, an evaluation data set, and an ensemble training data set (all in a list). If Ensemble is FALSE, then all items returned except the ensemble training set.

```
data <- data.table::data.table(DateTime = as.Date(Sys.time()),
  Target = stats::filter(rnorm(1000,
                               mean = 50,
                               sd = 20),
                         filter=rep(1,10),
                         circular=TRUE))
data[, temp := seq(1:1000)][, DateTime := DateTime - temp][, temp := NULL]
data <- data[order(DateTime)]
output <-   AutoTS(data,
                   TargetName     = "Target",
                   DateName       = "DateTime",
                   FCPeriods      = 30,
                   HoldOutPeriods = 30,
                TimeUnit      = "day", # c("hour","day","week","month","quarter","year"),
                   Lags           = 5,
                   SLags          = 1,
                   NumCores       = 4,
                   SkipModels     = NULL,
                   StepWise       = TRUE)
```

ChartTheme *ChartTheme function is a ggplot theme generator for ggplots*

Description

This function helps your ggplots look professional with the choice of the two main colors that will dominate the theme

Usage

```
ChartTheme(Size = 12)
```

Arguments

Size	The size of the axis labels and title

Value

An object to pass along to ggplot objects following the "+" sign

p <- p + ChartTheme(Size = 12)
```

DT_GDL_Feature_Engineering

An Automated Feature Engineering Function Using data.table frollmean

---

Description

Builds autoregressive and moving average from target columns and distributed lags and distributed moving average for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and moving averages. This function works for data with groups and without groups.

Usage

```
DT_GDL_Feature_Engineering(data, lags = c(seq(1, 50, 1)),
  periods = c(seq(5, 95, 5)), statsNames = c("MA"),
  targets = c("qty"), groupingVars = c("Group1", "Group2"),
  sortDateName = c("date"), timeDiffTarget = c("TimeDiffName"),
  timeAgg = c("days"), WindowingLag = 0, Type = c("Lag"),
  Timer = TRUE, SkipCols = NULL, SimpleImpute = TRUE)
```

Arguments

data	The data source you want to run the function on
lags	The list of specific lags you want to have generated
periods	The number of periods for the rolling stats
statsNames	The corresponding names to append to your colnames created associated with statsFuns
targets	The column(s) in which you will build your lags and rolling stats
groupingVars	Categorical variables you will build your lags and rolling stats by
sortDateName	String name of your core date column in your transaction data
timeDiffTarget	List a name in order to create time between events with assiciated lags and rolling features
timeAgg	Unit of time to aggregate by
WindowingLag	Build moving stats off of target column(s) or one of their lags (1+)
Type	input "Lag" if you want features built on historical values; use "Lead" if you want features built on future values
Timer	Set to TRUE if you want a time run for the operation; useful when there is grouping
SkipCols	Defaults to NULL; otherwise name the vector containing the names of columns to skip
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1

Value

data.table of original data plus newly created features

Author(s)

Adrian Antico

Examples

```
N = 25116
data <- data.table::data.table(DateTime = as.Date(Sys.time()),
                               Target = stats::filter(rnorm(N,
                                                            mean = 50,
                                                            sd = 20),
                                                      filter=rep(1,10),
                                                      circular=TRUE))
data[, temp := seq(1:N)][, DateTime := DateTime - temp][, temp := NULL]
data <- data[order(DateTime)]
data <- DT_GDL_Feature_Engineering(data,
                                   lags           = c(seq(1,5,1)),
                                   periods        = c(3,5,10,15,20,25),
                                   statsNames     = c("MA"),
```

```
targets        = c("Target"),
groupingVars   = NULL,
sortDateName   = "DateTime",
timeDiffTarget = c("Time_Gap"),
timeAgg        = c("days"),
WindowingLag   = 1,
Type           = "Lag",
Timer          = TRUE,
SkipCols       = FALSE,
SimpleImpute   = TRUE)
```

`DummifyDT` *DummifyDT creates dummy variables for the selected columns.*

Description

DummifyDT creates dummy variables for the selected columns. Either one-hot encoding, N+1 columns for N levels, or N columns for N levels.

Usage

```
DummifyDT(data, cols, KeepBaseCols = TRUE, OneHot = TRUE)
```

Arguments

`data`	the data set to run the micro auc on
`cols`	a vector with the names of the columns you wish to dichotomize
`KeepBaseCols`	set to TRUE to keep the original columns used in the dichotomization process
`OneHot`	Set to TRUE to run one hot encoding, FALSE to generate N columns for N levels

Value

data table with new dummy variables columns and optionally removes base columns

Examples

```
test <- data.table::data.table(Value = runif(100000),
                  FactorCol = sample(x = c(letters,
                                           LETTERS,
                                           paste0(letters,letters),
                                           paste0(LETTERS,LETTERS),
                                           paste0(letters,LETTERS),
                                           paste0(LETTERS,letters)),
                                     size = 100000,
                                     replace = TRUE))
test <- DummifyDT(data = test,
                  cols = "FactorCol",
                  KeepBaseCols = FALSE)
ncol(test)
test[, sum(FactorCol_gg)]
```

`EvalPlot` *Function automatically builds calibration plots for model evaluation*

Description

This function automatically builds calibration plots and calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```
EvalPlot(data, PredColName = c("PredictedValues"),
  ActColName = c("ActualValues"), type = c("calibration"),
  bucket = 0.05, aggrfun = function(x) base::mean(x, na.rm = TRUE))
```

Arguments

`data`	Data containing predicted values and actual values for comparison
`PredColName`	String representation of column name with predicted values from model
`ActColName`	String representation of column name with actual values from model
`type`	Calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation
`bucket`	Number of buckets to partition the space on (0,1) for evaluation
`aggrfun`	The statistics function used in aggregation, listed as a function

Value

Calibration plot or boxplot

Author(s)

Adrian Antico

         PredColName = "predict",
         ActColName  = "target",
         type        = "calibration",
         bucket      = 0.05,
         aggrfun     = function(x) quantile(x, probs = 0.50, na.rm = TRUE))

## End(Not run)
```

FAST_GDL_Feature_Engineering

An Fast Automated Feature Engineering Function

Description

For models with target variables within the realm of the current time frame but not too far back in time, this function creates autoregressive and rolling stats from target columns and distributed lags and distributed rolling stats for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and rolling stats. This function works for data with groups and without groups.

Usage

```
FAST_GDL_Feature_Engineering(data, lags = c(1:5), periods = c(seq(10,
  50, 10)), statsFUNs = c("mean", "median", "sd", "quantile85",
  "quantile95"), statsNames = c("mean", "median", "sd", "quantile85",
  "quantile95"), targets = c("Target"),
  groupingVars = c("GroupVariable"), sortDateName = c("DateTime"),
  timeDiffTarget = NULL, timeAgg = c("hours"), WindowingLag = 1,
  Type = c("Lag"), Timer = FALSE, SkipCols = FALSE,
  SimpleImpute = TRUE, AscRowByGroup = c("temp"), RecordsKeep = 1)
```

Arguments

data	The data source you want to run the function on
lags	The list of specific lags you want to have generated
periods	The number of periods for the rolling stats
statsFUNs	List of functions for your rolling windows, such as mean, sd, min, max, quantile
statsNames	The corresponding names to append to your colnames created associated with statsFuns
targets	The column(s) in which you will build your lags and rolling stats
groupingVars	Categorical variables you will build your lags and rolling stats by
sortDateName	String name of your core date column in your transaction data
timeDiffTarget	List a name in order to create time between events with assiciated lags and rolling features
timeAgg	Unit of time to aggregate by

WindowingLag	Build moving stats off of target column(s) or one of their lags (1+)
Type	input "Lag" if you want features built on historical values; use "Lead" if you want features built on future values
Timer	Set to TRUE if you want a time run for the operation; useful when there is grouping
SkipCols	Defaults to NULL; otherwise name the vector containing the names of columns to skip
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1
AscRowByGroup	Required to have a column with a Row Number by group (if grouping) with 1 being the record for scoring (typically the most current in time)
RecordsKeep	List the number of records to retain (1 for last record, 2 for last 2 records, etc.)

Value

data.table of original data plus newly created features

Author(s)

Adrian Antico

```

GDL_Feature_Engineering

An Automated Feature Engineering Function

Description

Builds autoregressive and rolling stats from target columns and distributed lags and distributed rolling stats for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and rolling stats. This function works for data with groups and without groups.

Usage

```
GDL_Feature_Engineering(data, lags = c(seq(1, 5, 1)), periods = c(3, 5,
  10, 15, 20, 25), statsFUNs = c(function(x) quantile(x, probs = 0.1,
  na.rm = TRUE), function(x) quantile(x, probs = 0.9, na.rm = TRUE),
  function(x) base::mean(x, na.rm = TRUE), function(x) sd(x, na.rm = TRUE),
  function(x) quantile(x, probs = 0.25, na.rm = TRUE), function(x)
  quantile(x, probs = 0.75, na.rm = TRUE)), statsNames = c("q10", "q90",
  "mean", "sd", "q25", "q75"), targets = c("qty"),
  groupingVars = c("Group1", "Group2"), sortDateName = c("date"),
  timeDiffTarget = c("TimeDiffName"), timeAgg = c("days"),
  WindowingLag = 0, Type = c("Lag"), Timer = TRUE, SkipCols = NULL,
  SimpleImpute = TRUE)
```

Arguments

data	The data source you want to run the function on
lags	The list of specific lags you want to have generated
periods	The number of periods to use for rolling stats
statsFUNs	List of functions for your rolling windows, such as mean, sd, min, max, quantile
statsNames	The corresponding names to append to your colnames created associated with statsFuns
targets	The column(s) in which you will build your lags and rolling stats
groupingVars	Categorical variables you will build your lags and rolling stats by
sortDateName	String name of your core date column in your transaction data
timeDiffTarget	List a name in order to create time between events with assiciated lags and rolling features
timeAgg	Unit of time to aggregate by

WindowingLag	Build moving stats off of target column(s) or one of their lags (1+)
Type	input "Lag" if you want features built on historical values; use "Lead" if you want features built on future values
Timer	Set to TRUE if you want a time run for the operation; useful when there is grouping
SkipCols	Defaults to NULL; otherwise name the vector containing the names of columns to skip
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1

Value

data.table of original data plus newly created features

GenTSAnomVars *GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure*

Description

GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure. Data is z-scaled and grouped by factors and time periods to determine which points are above and below the control limits in a cumulative time fashion. Then a cumulative rate is created as the final variable. Set KeepAllCols to FALSE to utilize the intermediate features to create rolling stats from them.

Usage

```
GenTSAnomVars(data, ValueCol = "Value", GroupVar1 = "SKU",
  GroupVar2 = NULL, DateVar = "DATE", High = 1.96, Low = -1.96,
  KeepAllCols = FALSE, DataScaled = TRUE)
```

Arguments

data	the source residuals data.table
ValueCol	the numeric column to run anomaly detection over
GroupVar1	this is a group by variable
GroupVar2	this is another group by variable
DateVar	this is a time variable for grouping
High	this is the threshold on the high end
Low	this is the threshold on the low end
KeepAllCols	set to TRUE to remove the intermediate features
DataScaled	set to TRUE if you already scaled your data

Value

The original data.table with the added columns merged in

                          DataScaled  = FALSE)
```

GLRM_KMeans_Col *GLRM_KMeans_Col Automated row clustering for mixed column types*

Description

GLRM_KMeans_Col adds a column to your original data with a cluster number identifier. Uses glrm (grid tune-able) and then k-means to find optimal k.

Usage

```
GLRM_KMeans_Col(data, GridTuneGLRM = TRUE, GridTuneKMeans = TRUE,
  nthreads = 4, MaxMem = "14G", glrmCols = 3:ncol(data),
  IgnoreConstCols = TRUE, glrmFactors = 5, Loss = "Absolute",
  glrmMaxIters = 1000, SVDMethod = "Randomized",
  MaxRunTimeSecs = 3600, KMeansK = 50, KMeansMetric = "totss")
```

Arguments

data	is the source time series data.table
GridTuneGLRM	If you want to grid tune the glrm model, set to TRUE, FALSE otherwise
GridTuneKMeans	If you want to grid tuen the KMeans model, set to TRUE, FALSE otherwise
nthreads	set based on number of threads your machine has available
MaxMem	set based on the amount of memory your machine has available
glrmCols	the column numbers for the glrm
IgnoreConstCols	tell H20 to ignore any columns that have zero variance
glrmFactors	similar to the number of factors to return from PCA
Loss	set to one of "Quadratic", "Absolute", "Huber", "Poisson", "Hinge", "Logistic", "Periodic"
glrmMaxIters	max number of iterations
SVDMethod	choose from "Randomized","GramSVD","Power"
MaxRunTimeSecs	set the timeout for max run time
KMeansK	number of factors to test out in k-means to find the optimal number
KMeansMetric	pick the metric to identify top model in grid tune c("totss","betweenss","withinss")

Value

Original data.table with added column with cluster number identifier

ModelDataPrep *Final Data Preparation Function*

Description

This function replaces inf values with NA, converts characters to factors, and imputes with constants

Usage

```
ModelDataPrep(data, Impute = TRUE, CharToFactor = TRUE,
  MissFactor = "0", MissNum = -1)
```

Arguments

data	This is your source data you'd like to modify
Impute	Defaults to TRUE which tells the function to impute the data
CharToFactor	Defaults to TRUE which tells the function to convert characters to factors
MissFactor	Supply the value to impute missing factor levels
MissNum	Supply the value to impute missing numeric values

Value

Returns the original data table with corrected values

multiplot *Multiplot is a function for combining multiple plots*

Description

Sick of copying this one into your code? Well, not anymore.

Usage

```
multiplot(..., plotlist = NULL, cols = 2, layout = NULL)
```

Arguments

...	Passthrough arguments
plotlist	This is the list of your charts
cols	This is the number of columns in your multiplot
layout	Leave NULL

Value

Multiple ggplots on a single image

## End(Not run)
```

---

nlsModelFit *nlsModelFit is a function for automatically building nls models*

Description

This function will build models for 9 different nls models, along with a non-parametric monotonic regression and a polynomial regression. The models are evaluated, a winner is picked, and the predicted values are stored in your data table.

Usage

```
nlsModelFit(data, y, x, monotonic = TRUE)
```

Arguments

data	Data is the data table you are building the modeling on
y	Y is the target variable name in quotes
x	X is the independent variable name in quotes
monotonic	This is a TRUE/FALSE indicator - choose TRUE if you want monotonic regression over polynomial regression

Value

A data table with your original column replaced by the nls model predictions

Author(s)

Adrian Antico

See Also

Other Supervised Learning: AutoH20Modeler, AutoTS

Examples

```
data <- data.table::data.table(Variable = seq(1,500,1), Target = rep(1, 500))
for (i in as.integer(1:500)) {
  if(i == 1) {
    var <- data[i, "Variable"][[1]]
    data.table::set(data, i = i, j = 2L, value = var * (1 + runif(1)/100))
} else {
    var = data[i-1, "Target"][[1]]
    data.table::set(data, i = i, j = 2L, value = var * (1 + runif(1)/100))
  }
}

# To keep original values
data1 <- data.table::copy(data)

# Merge and Model data
data2 <- merge(data1,
               nlsModelFit(data = data, y = "Target", x = "Variable", monotonic = FALSE),
                by = "Variable",
                all = TRUE)

# Plot graphs of predicted vs actual
p <- ggplot2::ggplot(data2, ggplot2::aes(x = Variable)) +
  ggplot2::geom_line(ggplot2::aes(y = data2[["Target.x"]], color = "blue")) +

  ChartTheme(Size = 12) + ggplot2::ggtitle("Growth Models") +
  ggplot2::ylab("Target Variable") + ggplot2::xlab("Independent Variable")
```

ParDepCalPlots *Function automatically builds partial dependence calibration plots for model evaluation*

Description

This function automatically builds partial dependence calibration plots and partial dependence calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```
ParDepCalPlots(data, PredColName = c("PredictedValues"),
  ActColName = c("ActualValues"),
  IndepVar = c("Independent_Variable_Name"), type = c("calibration"),
  bucket = 0.05, FactLevels = 10, Function = function(x)
  base::mean(x, na.rm = TRUE))
```

Arguments

data	Data containing predicted values and actual values for comparison
PredColName	String representation of the column name with predicted values from model
ActColName	String representation of the column name with actual values from model
IndepVar	String representation of the column name with the independent variable of choice
type	Calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation
bucket	Number of buckets to partition the space on (0,1) for evaluation
FactLevels	The number of levels to show on the chart (1. Levels are chosen based on frequency; 2. all other levels grouped and labeled as "Other")
Function	Supply the function you wish to use for aggregation.

Value

Partial dependence calibration plot or boxplot

## End(Not run)
```

---

percRank *Percentile rank function*

Description

This function computes percentile ranks for each row in your data like Excel's PERCENT_RANK

Usage

```
percRank(x)
```

Arguments

x	X is your variable of interest

Value

vector of percentile ranks

Author(s)

Adrian Antico

## End(Not run)
```

`RedYellowGreen` *RedYellowGreen is for determining the optimal thresholds for binary classification when do-nothing is an option*

Description

This function will find the optimial thresholds for applying the main label and for finding the optimial range for doing nothing when you can quantity the cost of doing nothing

Usage

```
RedYellowGreen(data, PredictColNumber = 2, ActualColNumber = 1,
  TruePositiveCost = 0, TrueNegativeCost = 0,
  FalsePositiveCost = -10, FalseNegativeCost = -50, MidTierCost = -2,
  Cores = 8, Precision = 0.01)
```

Arguments

`data`	data is the data table with your predicted and actual values from a classification model
`PredictColNumber`	The column number where the actual target variable is located (in binary form)
`ActualColNumber`	The column number where the predicted values are located
`TruePositiveCost`	This is the utility for generating a true positive prediction
`TrueNegativeCost`	This is the utility for generating a true negative prediction
`FalsePositiveCost`	This is the cost of generating a false positive prediction
`FalseNegativeCost`	This is the cost of generating a false negative prediction
`MidTierCost`	This is the cost of doing nothing (or whatever it means to not classify in your case)
`Cores`	Number of cores on your machine
`Precision`	Set the decimal number to increment by between 0 and 1

Value

A data table with all evaluated strategies, parameters, and utilities, along with a 3d scatterplot of the results

`ResidualOutliers` *ResidualOutliers is an automated time series outlier detection function*

Description

ResidualOutliers is an automated time series outlier detection function that utilizes tsoutliers and auto.arima.

Usage

```
ResidualOutliers(data, maxN = 5, cvar = 4)
```

Arguments

`data`	the source residuals data.table
`maxN`	the largest lag or moving average (seasonal too) values for the arima fit
`cvar`	the t-stat value for tsoutliers

Value

A data.table with outliers, the arima model, and residuals from the arima fit

`Scoring_GDL_Feature_Engineering`
An Automated Scoring Feature Engineering Function

Description

For scoring purposes (brings back a single row by group), this function creates autoregressive and rolling stats from target columns and distributed lags and distributed rolling stats for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and rolling stats. This function works for data with groups and without groups.

Usage

```
Scoring_GDL_Feature_Engineering(data, lags = c(1:6, 12, seq(24, 168,
  24)), periods = c(6, 12, 24, 72, 168, 720, 4320, 8640),
  statsFUNs = c(function(x) base::mean(x, na.rm = TRUE), function(x)
  base::sd(x, na.rm = TRUE)), statsNames = c("mean", "sd"),
  targets = c("Target"), groupingVars = c("GroupVariable"),
  sortDateName = c("DateTime"), timeDiffTarget = c("Time_Gap"),
  timeAgg = c("days"), WindowingLag = 1, Type = c("Lag"),
  Timer = FALSE, SkipCols = FALSE, SimpleImpute = TRUE,
  AscRowByGroup = c("temp"), RecordsKeep = 1)
```

Arguments

`data`	The data source you want to run the function on
`lags`	The list of specific lags you want to have generated
`periods`	The number of periods in the rolling statistics
`statsFUNs`	List of functions for your rolling windows, such as mean, sd, min, max, quantile
`statsNames`	The corresponding names to append to your colnames created associated with statsFuns
`targets`	The column(s) in which you will build your lags and rolling stats
`groupingVars`	Categorical variables you will build your lags and rolling stats by
`sortDateName`	String name of your core date column in your transaction data
`timeDiffTarget`	List a name in order to create time between events with assiciated lags and rolling features
`timeAgg`	Unit of time to aggregate by
`WindowingLag`	Build moving stats off of target column(s) or one of their lags (1+)
`Type`	input "Lag" if you want features built on historical values; use "Lead" if you want features built on future values
`Timer`	Set to TRUE if you want a time run for the operation; useful when there is grouping
`SkipCols`	Defaults to NULL; otherwise name the vector containing the names of columns to skip

SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1
AscRowByGroup	Required to have a column with a Row Number by group (if grouping) with 1 being the record for scoring (typically the most current in time)
RecordsKeep	List the number of records to retain (1 for last record, 2 for last 2 records, etc.)

Value

data.table of original data plus newly created features

`SimpleCap` *SimpleCap function is for capitalizing the first letter of words*

Description

SimpleCap function is for capitalizing the first letter of words (need I say more?)

Usage

```
SimpleCap(x)
```

Arguments

`x`	Column of interest

Value

An object to pass along to ggplot objects following the "+" sign

Author(s)

Adrian Antico

See Also

Other Misc: `ChartTheme`, `PrintObjectsSize`, `RemixTheme`, `WordFreq`, `multiplot`, `percRank`, `tempDatesFun`, `tokenizeH20`

Examples

```
x <- "adrian"
x <- SimpleCap(x)
```

`tempDatesFun` *tempDatesFun Convert Excel datetime char columns to Date columns*

Description

tempDatesFun takes the Excel datetime column, which imports as character, and converts it into a date type

Usage

```
tempDatesFun(x)
```

Arguments

`x`	The column of interest

Value

An object to pass along to ggplot objects following the "+" sign

Author(s)

Adrian Antico

See Also

Other Misc: ChartTheme, PrintObjectsSize, RemixTheme, SimpleCap, WordFreq, multiplot, percRank, tokenizeH20

Examples

```
## Not run:
Cdata[, DAY_DATE := tempDatesFun(DAY_DATE)]
Cdata[, DAY_DATE := base::as.Date(DAY_DATE, "%m/%d/%Y")]

## End(Not run)
```

---

threshOptim *Utility maximizing thresholds for binary classification*

Description

This function will return the utility maximizing threshold for future predictions along with the data generated to estimate the threshold

Usage

```
threshOptim(data, actTar = "target", predTar = "p1", tpProfit = 0,
  tnProfit = 0, fpProfit = -1, fnProfit = -2)
```

Arguments

data	data is the data table you are building the modeling on
actTar	The column name where the actual target variable is located (in binary form)
predTar	The column name where the predicted values are located
tpProfit	This is the utility for generating a true positive prediction
tnProfit	This is the utility for generating a true negative prediction
fpProfit	This is the cost of generating a false positive prediction
fnProfit	This is the cost of generating a false negative prediction

Value

Optimal threshold and corresponding utilities for the range of thresholds tested

Author(s)

Adrian Antico

tokenizeH20 *For NLP work*

Description

This function tokenizes data

Usage

```
tokenizeH20(data)
```

Arguments

data	The text data

Author(s)

Adrian Antico at RemixInstitute.com

Word2VecModel *Automated word2vec data generation via H20*

Description

This function allows you to automatically build a word2vec model and merge the data onto your supplied dataset

Usage

```
Word2VecModel(data, stringCol = c("Text_Col1", "Text_Col2"),
  KeepStringCol = FALSE, model_path = getwd(),
  ModelID = c("Text_Col1", "Text_Col2"), vects = 5,
  SaveStopWords = FALSE, MinWords = 1, WindowSize = 1, Epochs = 25,
  StopWords = NULL, SaveModel = "standard", Threads = 4,
  MaxMemory = "14G")
```

Arguments

data	Source data table to merge vects onto
stringCol	A string name for the column to convert via word2vec
KeepStringCol	Set to TRUE if you want to keep the original string column that you convert via word2vec
model_path	A string path to the location where you want the model and metadata stored
ModelID	A vector of your model names
vects	The number of vectors to retain from the word2vec model
SaveStopWords	Set to TRUE to save the stop words used
MinWords	For H20 word2vec model
WindowSize	For H20 word2vec model
Epochs	For H20 word2vec model
StopWords	For H20 word2vec model
SaveModel	Set to "standard" to save normally; set to "mojo" to save as mojo
Threads	Number of available threads you want to dedicate to model building
MaxMemory	Amount of memory you want to dedicate to model building

                      StopWords     = NULL)

## End(Not run)
```

WordFreq *Automated Word Frequency and Word Cloud Creation*

Description

This function builds a word frequency table and a word cloud. It prepares data, cleans text, and generates output.

Usage

```
WordFreq(data, TextColName = "DESCR",
  ClusterCol = "ClusterAllNoTarget", ClusterID = 0,
  RemoveEnglishStopwords = TRUE, Stemming = TRUE,
  StopWords = c("bla", "blab2"))
```

Arguments

`data`	Source data table
`TextColName`	A string name for the column
`ClusterCol`	Set to NULL to ignore, otherwise set to Cluster column name (or factor column name)
`ClusterID`	Must be set if ClusterCol is defined. Set to cluster ID (or factor level)
`RemoveEnglishStopwords`	Set to TRUE to remove English stop words, FALSE to ignore
`Stemming`	Set to TRUE to run stemming on your text data
`StopWords`	Add your own stopwords, in vector format

Author(s)

Adrian Antico
