

Package ‘RemixAutoML’

October 8, 2020

Title Remix Automated Machine Learning

Version 0.2.4

Date 2020-10-08

Maintainer Adrian Antico <adrianantico@gmail.com>

Description R package for the automation of machine learning, forecasting, feature engineering, model evaluation, model interpretation, data generation, and recommenders. Build using data.table for all tabular data-related tasks.

License MPL-2.0 | file LICENSE

URL <https://github.com/AdrianAntico/RemixAutoML>

BugReports <https://github.com/AdrianAntico/RemixAutoML/issues>

Depends R (>= 3.5.0)

Imports arules, bit64, catboost, combinat, data.table, doParallel, e1071, fBasics, foreach, forecast, ggplot2, grid, h2o, itertools, lime, lubridate, methods, MLmetrics, monreg, nortest, parallel, pROC, RColorBrewer, recommenderlab, scatterplot3d, stats, stringr, timeDate, tsoutliers, wordcloud, xgboost

Suggests knitr, rmarkdown, sde, testthat, fpp, gridExtra

VignetteBuilder knitr

RemixAutoML-package	<i>Automated Machine Learning Remixed</i>
---------------------	---

Description

Automated Machine Learning Remixed for real-world use-cases. The package utilizes data.table under the hood for all data wrangling like operations so it's super fast and memory efficient. All ML methods are available in R or Python. The forecasting functions are unique and state of the art. There are feature engineering functions in this package that you cannot find anywhere else.

Details

See the github README for details and examples www.github.com/AdrianAntico/RemixAutoML

AutoBanditNNet	<i>AutoBanditNNet</i>
----------------	-----------------------

Description

AutoBanditNNet is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The parameter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```

AutoBanditNNet(
  data,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxSeasonalLags = 1L,
  MaxFourierPairs = 2L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L
)

```

Arguments

<code>data</code>	Source data.table
<code>TargetVariableName</code>	Name of your time series target variable
<code>DateColumnName</code>	Name of your date column
<code>TimeAggLevel</code>	Choose from "year", "quarter", "month", "week", "day", "hour"
<code>EvaluationMetric</code>	Choose from MAE, MSE, and MAPE
<code>NumHoldOutPeriods</code>	Number of time periods to use in the out of sample testing
<code>NumFCPeriods</code>	Number of periods to forecast
<code>MaxLags</code>	A single value of the max number of lags to test
<code>MaxSeasonalLags</code>	A single value of the max number of seasonal lags to test
<code>MaxFourierPairs</code>	A single value of the max number of fourier pairs to test
<code>TrainWeighting</code>	Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.
<code>MaxConsecutiveFails</code>	When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attempts without a new winner before terminating the procedure.
<code>MaxNumberModels</code>	Indicate the maximum number of models to test.
<code>MaxRunTimeMinutes</code>	Indicate the maximum number of minutes to wait for a result.

AutoBanditSarima

AutoBanditSarima

Description

AutoBanditSarima is a multi-armed bandit model testing framework for SARIMA. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic auto.arima from the forecast package. Depending on how many lags, moving averages, seasonal lags and moving averages you test the number of combinations of features to test begins to approach 100,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags and moving averages. The parameter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```
AutoBanditSarima(
  data,
  ByDataType = TRUE,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxSeasonallLags = 0L,
  MaxMovingAverages = 5L,
  MaxSeasonalMovingAverages = 0L,
  MaxFourierPairs = 2L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 25L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, parallel::detectCores()),
  DebugMode = FALSE
)
```

Arguments

<code>data</code>	Source data.table
<code>ByDataType</code>	TRUE returns the best model from the four base sets of possible models. FALSE returns the best model.
<code>TargetVariableName</code>	Name of your time series target variable
<code>DateColumnName</code>	Name of your date column
<code>TimeAggLevel</code>	Choose from "year", "quarter", "month", "week", "day", "hour"
<code>EvaluationMetric</code>	Choose from MAE, MSE, and MAPE
<code>NumHoldOutPeriods</code>	Number of time periods to use in the out of sample testing
<code>NumFCPeriods</code>	Number of periods to forecast
<code>MaxLags</code>	A single value of the max number of lags to test
<code>MaxSeasonalLags</code>	A single value of the max number of seasonal lags to test
<code>MaxMovingAverages</code>	A single value of the max number of moving averages to test
<code>MaxSeasonalMovingAverages</code>	A single value of the max number of seasonal moving averages to test
<code>MaxFourierPairs</code>	A single value of the max number of fourier pairs to test
<code>TrainWeighting</code>	Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.
<code>MaxConsecutiveFails</code>	When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attempts without a new winner before terminating the procedure.
<code>MaxNumberModels</code>	Indicate the maximum number of models to test.
<code>MaxRunTimeMinutes</code>	Indicate the maximum number of minutes to wait for a result.
<code>NumberCores</code>	Number of cores to use in parallelism. E.g. if you have a 4 core CPU then supply 4 if you want to utilize all four cores
<code>DebugMode</code>	Set to TRUE to get print outs of particular steps helpful in tracing errors

Value

data.table containing historical values and the forecast values along with the grid tuning results in full detail, as a second data.table

Skew_Periods_ = c(3:5),
Kurt_Periods_ = c(4:5),
Quantile_Periods_ = c(3:5),
Quantiles_Selected_ = c("q5", "q95"),
FourierTerms_ = 4,
TimeTrendVariable_ = TRUE,
NTrees_ = 150,
DebugMode_ = TRUE,
OptionsWarn = 1
)

```

Arguments

ModelName	Choose from 'catboost', 'h2odrf', 'h2ogbm', 'h2oglm', 'h2oautoml', 'xgboost'
FeatureGridTune	Set to TRUE to only run in evaluation model opposed to TrainOnFull model which does not return model performance measures
MaxMem_	= "28G"
NThreads_	= parallel::detectCores() - 2
TreeMethod__	= "hist" or "gpu_hist" for xgboost carma
TestRows	= "ALL" to run all tests (see example for all tests), or a numeric vector with the row numbers from the test list (see example)

DataPath In quotes, provide the file path to where your data is stored

dataForecastX = "RawDataXREG.csv" Use quotes. # Be aware that grouped data and using XREGS_ requires that your joining group variables have the same name. MUST SUPPLY VALUE

dataX = "RawDataXREG.csv" Use quotes. # Be aware that grouped data and using XREGS_ requires that your joining group variables have the same name. MUST SUPPLY VALUE

XREGSX = "XREG.csv" Use quotes. # data.table with ONLY 3 COLUMN TYPES: 1: - GroupVariables_ and DateColumnName_ join-by variables with matching join column names and data types compared to data_ and; 2 - features - needs to exist for all historical periods matching data_ along with a sufficient amount of data to cover the forecast period as defined by FC_Periods_. OR Supply NULL to arg.

TargetColumnName_ = "Weekly_Sales" # WalmartData target column name.

DateColumnName_ = "Date" # Name of data_ date column name.

HierarchGroups_ = c("Store","Dept") # NULL otherwise

GroupVariables_ = c("Store","Dept") #

TimeUnit_ = "week" # Choices include "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year"

TimeGroups_ = c("weeks","months","quarter") # These will tell GDL to build gdl features along the time aggregation dimension

ZeroPadSeries_ = c('NULL', 'all', 'inner') ZeroPadSeries choose "all", "inner", or NULL. 'Outer' grows missing dates by group to the largest of all groups size. 'Inner' fills in series by using the group level's own max and min values (versus filling all group levels to the max value of the groups level with the widest time gap)

DataTruncate_ = FALSE # TRUE will truncate all rows where GDL columns produced a -1 (remove all rows where ID < max(rolling stats)). FALSE otherwise.

SplitRatios_ = c(1 - 10 / 143, 10 / 143) # If you have GroupVariables_ then base it on number of records in a group, like default

PartitionType_ = "timeseries" # always time series for this function. Place holder for other time series options down the road.

TrainOnFull_ = FALSE # Set to TRUE put in Forecast mode. FALSE to put in Evaluation mode. Forecast mode generates forecasts based on a model built using all of data_, and no evaluation metrics are collected when set to TRUE. Evaluation mode will build a forecast for your validation periods and collect the holdout metrics and other evaluation objects, but no future forecast beyond max date of data_. as specified in SplitRatios_.

FC_Periods_ = 4 # Self explanatory

EvalMetric_ = "RMSE" # "RMSE" only with catboost 17.5

GridTune_ = FALSE # NEEDS TO BE UPDATED ONCE BANDIT GRID TUNING WORKS.

GridEvalMetric_ = "mae" # 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'. If metric computation fails then no output is generated in final metric evaluation data.table

ModelCount_ = 5 # NEEDS TO BE UPDATED ONCE BANDIT GRID TUNING WORKS.

TaskType_ = "GPU" # Set to "CPU" to train on CPU versus GPU. Must supply a value.
 Timer_ = TRUE # Print out the forecast step the function is currently working on. If it errors on the first run scoring the model then it is likely a very different error then if has printed "Forecasting 1:"
 TargetTransformation_ = TRUE # Set to TRUE to have every available numeric transformation compete for best normalization fit to normal distribution
 Difference_ = TRUE # The I in ARIMA. Works for single series and grouped series a.k.a. panel data.
 CalendarVariables_ = TRUE # This TURNS ON procedure to create numeric calendar variables that your TimeUnit_ directs. FALSE otherwise.
 HolidayVariable_ = TRUE # This TURNS ON procedure to create a numeric holiday count variable. FALSE otherwise.
 HolidayLags_ = c(1:2) # Supply a numeric vector of lag periods
 HolidayMovingAverages_ = c(1:2) # Supply a numeric vector of Moving Average periods
 Lags_ = c(1:5) # Numeric vector of lag periods
 MA_Periods_ = c(1:5) # Numeric vector of lag periods
 SD_Periods_ = c(2:5) # Numeric vector of lag periods
 Skew_Periods_ = c(3:5) # Numeric vector of lag periods
 Kurt_Periods_ = c(4:5) # Numeric vector of lag periods
 Quantile_Periods_ = c(3:5) # Numeric vector of lag periods
 Quantiles_Selected_ = c("q5","q95") # Select the quantiles you want calculated. "q5", "q10", ..., "q95".
 FourierTerms_ = 2 # (TECHNICALLY FOURIER PAIRS) Hierarchy grouping (full group variable interaction set) is ran by default (MAKE INTO OPTION). Uses parallelization to loop through the unique set of all GroupVariables levels and computes fourier terms as if the group level's are a single series; just for all groups and it's parallelized.
 TimeTrendVariable_ = TRUE # Set to TRUE to have a sequence created from 1 to nrow by group or single series
 NTrees_ = 150 # Number of trees to have trained. Can be 10000 or more depending on group level size.
 DebugMode_ = TRUE # When TRUE it will print every comment section header line. When it crashes, you can get a print out of the last N steps that were ran, depending on the print max limit.
 OptionsWarn Set to 1 to print warnings immediately to screen versus after a function finishes; 2 to kill processes if a warning occurs. See options(warn =)

AutoCatBoostCARMA	<i>AutoCatBoostCARMA</i>
-------------------	--------------------------

Description

AutoCatBoostCARMA Multivariate Forecasting with calendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```
AutoCatBoostCARMA(
  data,
  NonNegativePred = FALSE,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,
  GroupVariables = NULL,
  FC_Periods = 30,
  TimeUnit = "week",
  TimeGroups = c("weeks", "months"),
  NumOfParDepPlots = 10L,
  TargetTransformation = FALSE,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  AnomalyDetection = NULL,
  XREGS = NULL,
  Lags = c(1L:5L),
  MA_Periods = c(2L:5L),
  SD_Periods = NULL,
  Skew_Periods = NULL,
  Kurt_Periods = NULL,
  Quantile_Periods = NULL,
  Quantiles_Selected = c("q5", "q95"),
  Difference = TRUE,
  FourierTerms = 6L,
  CalendarVariables = c("second", "minute", "hour", "wday", "mday", "yday", "week",
    "isoweek", "month", "quarter", "year"),
  HolidayVariable = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
    "OtherEcclesticalFeasts"),
  HolidayLags = 1L,
  HolidayMovingAverages = 1L:2L,
  TimeTrendVariable = FALSE,
  ZeroPadSeries = NULL,
  DataTruncate = FALSE,
  SplitRatios = c(0.7, 0.2, 0.1),
  TaskType = "GPU",
  NumGPU = 1,
  EvalMetric = "RMSE",
```

```

GridTune = FALSE,
GridEvalMetric = "mae",
ModelCount = 1,
MaxRunsWithoutNewWinner = 50,
MaxRunMinutes = 60 * 60,
NTrees = 1000,
L2_Leaf_Reg = 3,
Depth = 6,
PartitionType = "timeseries",
Timer = TRUE,
DebugMode = FALSE
)

```

Arguments

data	Supply your full series data set here
NonNegativePred	TRUE or FALSE
TrainOnFull	Set to TRUE to train on full data
TargetColumnName	List the column name of your target variables column. E.g. "Target"
DateColumnName	List the column name of your date column. E.g. "DateTime"
HierarchGroups	Vector of hierachy categorical columns.
GroupVariables	Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.
FC_Periods	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
TimeUnit	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
TimeGroups	Select time aggregations for adding various time aggregated GDL features.
NumOfParDepPlots	Supply a number for the number of partial dependence plots you want returned
TargetTransformation	Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
Methods	Transformation options to test which include "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"
AnomalyDetection	NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)
XREGS	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.
Lags	Select the periods for all lag variables you want to create. E.g. c(1:5,52)
MA_Periods	Select the periods for all moving average variables you want to create. E.g. c(1:5,52)
SD_Periods	Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)

Skew_Periods	Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)
Kurt_Periods	Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)
Quantile_Periods	Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)
Quantiles_Selected	Select from the following "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"
Difference	Puts the I in ARIMA for single series and grouped series.
FourierTerms	Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interactions if hierarchy is enabled.
CalendarVariables	NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"
HolidayVariable	NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"
HolidayLags	Number of lags to build off of the holiday count variable.
HolidayMovingAverages	Number of moving averages to build off of the holiday count variable.
TimeTrendVariable	Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.
ZeroPadSeries	Set to "all", "inner", or NULL. See TimeSeriesFill for explanation
DataTruncate	Set to TRUE to remove records with missing values from the lags and moving average features created
SplitRatios	E.g c(0.7,0.2,0.1) for train, validation, and test sets
TaskType	Default is "GPU" but you can also set it to "CPU"
NumGPU	Defaults to 1. If CPU is set this argument will be ignored.
EvalMetric	Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"
GridTune	Set to TRUE to run a grid tune
GridEvalMetric	This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'
ModelCount	Set the number of models to try in the grid tune
MaxRunsWithoutNewWinner	Default is 50
MaxRunMinutes	Default is 60*60
NTrees	Select the number of trees you want to have built to train the model
L2_Leaf_Reg	l2 reg parameter
Depth	Depth of catboost model

PartitionType	Select "random" for random data partitioning "timeseries" for partitioning by time frames
Timer	Set to FALSE to turn off the updating print statements for progress
DebugMode	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoCatBoostClassifier

AutoCatBoostClassifier is an automated catboost model grid-tuning classifier and evaluation system

Description

AutoCatBoostClassifier is an automated modeling function that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train, validation, and test sets (if not supplied). Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions (on test data), an ROC plot, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting. You can download the catboost package using devtools, via: `devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')`

Usage

```

AutoCatBoostClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  ClassWeights = NULL,
  IDcols = NULL,
  task_type = "GPU",
  NumGPUs = 1,
  eval_metric = "MCC",
  loss_function = NULL,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 0L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  PassInGrid = NULL,
  GridTune = FALSE,
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,

```

```

MaxRunMinutes = 24L * 60L,
Shuffles = 1L,
BaselineComparison = "default",
MetricPeriods = 10L,
Trees = 50L,
Depth = 6,
LearningRate = NULL,
L2_Leaf_Reg = 3,
RandomStrength = 1,
BorderCount = 128,
RSM = NULL,
BootStrapType = NULL,
GrowPolicy = NULL
)

```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data and skip over evaluation steps
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located, but not mixed types. Note that the target column needs to be a 0 1 numeric variable.
FeatureColNames	Either supply the feature column names OR the column number where the target is located, but not mixed types. Also, not zero-indexed.
PrimaryDateColumn	Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling
ClassWeights	Supply a vector of weights for your target classes. E.g. c(0.25, 1) to weight your 0 class by 0.25 and your 1 class by 1.
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
task_type	Set to "GPU" to utilize your GPU for training. Default is "CPU".
NumGPUs	Numeric. If you have 4 GPUs supply 4 as a value.
eval_metric	This is the metric used inside catboost to measure performance on validation data during a grid-tune. "AUC" is the default. 'Logloss', 'CrossEntropy', 'Precision', 'Recall', 'F1', 'BalancedAccuracy', 'BalancedErrorRate', 'MCC', 'Accuracy', 'CtrFactor', 'AUC', 'BrierScore', 'HingeLoss', 'HammingLoss', 'ZeroOneLoss', 'Kappa', 'WKappa', 'LogLikelihoodOfPrediction', 'TotalF1', 'PairLogit', 'PairLogitPairwise', 'PairAccuracy', 'QueryCrossEntropy', 'QuerySoftMax', 'PFound', 'NDCG', 'AverageGain', 'PrecisionAt', 'RecallAt', 'MAP'
loss_function	Default is NULL. Select the loss function of choice. c("MultiRMSE", 'Logloss', 'CrossEntropy', 'Lq',
model_path	A character string of your path file to where you want your output saved

metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
ReturnModelObjects	Set to TRUE to output all modeling objects. E.g. plots and evaluation metrics
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
PassInGrid	Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxModelsInGrid	Number of models to test from grid options.
MaxRunsWithoutNewWinner	A number
MaxRunMinutes	In minutes
Shuffles	Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MetricPeriods	Number of trees to build before evaluating intermediate metrics. Default is 10L
Trees	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)
Depth	Bandit grid partitioned Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
LearningRate	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)
L2_Leaf_Reg	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
RandomStrength	A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.
BorderCount	Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU
RSM	CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)

BootStrapType	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")
GrowPolicy	Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")

Value

Saves to file and returned in list: VariableImportance.csv, Model (the model), ValidationData.csv, ROC_Plot.png, EvaluationPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoCatBoostFreqSizeScoring

AutoCatBoostFreqSizeScoring is for scoring the models build with AutoCatBoostSizeFreqDist()

Description

AutoCatBoostFreqSizeScoring is for scoring the models build with AutoCatBoostSizeFreqDist(). It will return the predicted values for every quantile model for both distributions for 1 to the max forecast periods you provided to build the scoring data.

Usage

```

AutoCatBoostFreqSizeScoring(
  ScoringData,
  TargetColumnNames = NULL,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  CountQuantiles = seq(0.1, 0.9, 0.1),

```

```

SizeQuantiles = seq(0.1, 0.9, 0.1),
ModelPath = NULL,
ModelIDs = c("CountModel", "SizeModel"),
KeepFeatures = TRUE
)

```

Arguments

ScoringData The scoring data returned from `IntermittentDemandScoringDataGenerator()`

TargetColumnNames A character or numeric vector of the target names. E.g. `c("Counts", "TARGET_qty")`

FeatureColumnNames A character vector of column names or column numbers

IDcols ID columns you want returned with the data that is not a model feature

CountQuantiles A numerical vector of the quantiles used in model building

SizeQuantiles A numerical vector of the quantiles used in model building

ModelPath The path file to where you models were saved

ModelIDs The ID's used in model building

KeepFeatures Set to TRUE to return the features with the predicted values

Value

Returns a list of `CountData` scores, `SizeData` scores, along with count and size prediction column names

AutoCatBoostHurdleModel

AutoCatBoostHurdleModel for generalized hurdle modeling

Description

AutoCatBoostHurdleModel for generalized hurdle modeling. Check out the Readme.Rd on github for more background.

Usage

```
AutoCatBoostHurdleModel(
  data = NULL,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  ClassWeights = NULL,
  SplitRatios = c(0.7, 0.2, 0.1),
  task_type = "GPU",
  ModelID = "ModelTest",
  Paths = NULL,
  MetaDataPaths = NULL,
  SaveModelObjects = FALSE,
  ReturnModelObjects = TRUE,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL,
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 1L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 60L * 60L,
  Shuffles = 2L,
  MetricPeriods = 25L,
  Trees = seq(1000L, 5000L, 500L),
  Depth = 6,
  RandomStrength = 1,
  BorderCount = 128,
  LearningRate = seq(0.01, 0.1, 0.01),
  L2_Leaf_Reg = 3,
  RSM = c(0.8, 0.85, 0.9, 0.95, 1),
  BootStrapType = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),
  GrowPolicy = c("SymmetricTree", "Depthwise", "Lossguide")
)
```

Arguments

<code>data</code>	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
<code>TrainOnFull</code>	Set to TRUE to use all data
<code>ValidationData</code>	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
<code>TestData</code>	Source test data. Do not include a column that has the class labels for the buckets as they are created internally.
<code>Buckets</code>	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
<code>TargetColumnName</code>	Supply the column name or number for the target variable
<code>FeatureColNames</code>	Supply the column names or number of the features (not included the Primary-DateColumn)
<code>PrimaryDateColumn</code>	Supply a date column if the data is functionally related to it
<code>IDcols</code>	Includes PrimaryDateColumn and any other columns you want returned in the validation data with predictions
<code>TransformNumericColumns</code>	Transform numeric column inside the AutoCatBoostRegression() function
<code>Methods</code>	Choose transformation methods
<code>ClassWeights</code>	Utilize these for the classifier model
<code>SplitRatios</code>	Supply vector of partition ratios. For example, c(0.70,0.20,0,10).
<code>task_type</code>	Set to "GPU" or "CPU"
<code>ModelID</code>	Define a character name for your models
<code>Paths</code>	The path to your folder where you want your model information saved
<code>MetaDataPaths</code>	TA character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.
<code>SaveModelObjects</code>	Set to TRUE to save the model objects to file in the folders listed in Paths
<code>ReturnModelObjects</code>	TRUE to return the models
<code>NumOfParDepPlots</code>	Set to pull back N number of partial dependence calibration plots.
<code>PassInGrid</code>	Pass in a grid for changing up the parameter settings for catboost
<code>GridTune</code>	Set to TRUE if you want to grid tune the models
<code>BaselineComparison</code>	= "default",
<code>MaxModelsInGrid</code>	= 1L,
<code>MaxRunsWithoutNewWinner</code>	= 20L,
<code>MaxRunMinutes</code>	= 60L*60L,

```

Shuffles          = 2L,
MetricPeriods     = 25L,
Trees             = seq(1000L, 5000L, 500L),
Depth            = seq(4L, 8L, 1L),
RandomStrength    1
BorderCount       128
LearningRate      = seq(0.01,0.10,0.01),
L2_Leaf_Reg       = seq(1.0, 10.0, 1.0),
RSM               = c(0.80, 0.85, 0.90, 0.95, 1.0),
BootStrapType     = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),
GrowPolicy        = c("SymmetricTree", "Depthwise", "Lossguide")

```

Value

Returns AutoCatBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and catboost-grid

AutoCatBoostMultiClass

AutoCatBoostMultiClass is an automated catboost model grid-tuning multinomial classifier and evaluation system

Description

AutoCatBoostMultiClass is an automated modeling function that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, variable importance, and column names used in model fitting. You can download the catboost package using devtools, via: `devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')`.

Usage

```

AutoCatBoostMultiClass(
  data,
  TrainOnFull = FALSE,

```

```

ValidationData = NULL,
TestData = NULL,
TargetColumnName = NULL,
FeatureColNames = NULL,
PrimaryDateColumn = NULL,
ClassWeights = NULL,
IDcols = NULL,
task_type = "GPU",
eval_metric = "MultiClassOneVsAll",
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
PassInGrid = NULL,
GridTune = FALSE,
MaxModelsInGrid = 10L,
MaxRunsWithoutNewWinner = 20L,
MaxRunMinutes = 24L * 60L,
grid_eval_metric = "Accuracy",
Shuffles = 1L,
BaselineComparison = "default",
MetricPeriods = 10L,
Trees = 50L,
Depth = 6,
LearningRate = NULL,
L2_Leaf_Reg = NULL,
RandomStrength = 1,
BorderCount = 128,
RSM = NULL,
BootStrapType = NULL,
GrowPolicy = NULL
)

```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data and skip over evaluation steps
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located, but not mixed types. Note that the target column needs to be a 0 1 numeric variable.
FeatureColNames	Either supply the feature column names OR the column number where the target is located, but not mixed types. Also, not zero-indexed.

PrimaryDateColumn	Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling
ClassWeights	Supply a vector of weights for your target classes. E.g. c(0.25, 1) to weight your 0 class by 0.25 and your 1 class by 1.
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
task_type	Set to "GPU" to utilize your GPU for training. Default is "CPU".
eval_metric	This is the metric used inside catboost to measure performance on validation data during a grid-tune. MultiClass or MultiClassOneVsAll
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnModelObjects	Set to TRUE to output all modeling objects. E.g. plots and evaluation metrics
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
PassInGrid	Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxModelsInGrid	Number of models to test from grid options.
MaxRunsWithoutNewWinner	A number
MaxRunMinutes	In minutes
grid_eval_metric	For evaluating models within grid tuning. Choices include, "accuracy", "microauc", "logloss"
Shuffles	Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MetricPeriods	Number of trees to build before evaluating intermediate metrics. Default is 10L
Trees	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)
Depth	Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
LearningRate	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

L2_Leaf_Reg	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
RandomStrength	A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.
BorderCount	Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU
RSM	CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)
BootStrapType	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")
GrowPolicy	Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")

Value

Saves to file and returned in list: VariableImportance.csv, Model (the model), ValidationData.csv, EvaluationMetrics.csv, GridCollect, and GridList

AutoCatBoostRegression

AutoCatBoostRegression is an automated catboost model grid-tuning classifier and evaluation system

Description

AutoCatBoostRegression is an automated modeling function that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting. You can download the catboost package using devtools, via: `devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')`

Usage

```

AutoCatBoostRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  task_type = "GPU",
  NumGPUs = 1,
  eval_metric = "RMSE",
  loss_function = "RMSE",
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 0L,
  EvalPlots = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  PassInGrid = NULL,
  GridTune = FALSE,
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  Shuffles = 1L,
  BaselineComparison = "default",
  MetricPeriods = 10L,
  Trees = 50L,
  Depth = 6,
  L2_Leaf_Reg = 3,
  RandomStrength = 1,
  BorderCount = 128,
  LearningRate = NULL,
  RSM = NULL,
  BootstrapType = NULL,
  GrowPolicy = NULL
)

```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data and skip over evaluation steps
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
PrimaryDateColumn	Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
TransformNumericColumns	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
Methods	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
task_type	Set to "GPU" to utilize your GPU for training. Default is "CPU".
NumGPUs	Set to 1, 2, 3, etc.
eval_metric	This is the metric used inside catboost to measure performance on validation data during a grid-tune. "RMSE" is the default, but other options include: "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError".
loss_function	Used in model training for model fitting. Select from 'RMSE', 'MAE', 'Quantile', 'LogLinQuantile', 'MAPE', 'Poisson', 'PairLogitPairwise', 'Tweedie', 'QueryRMSE'
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
EvalPlots	Defaults to TRUE. Set to FALSE to not generate and return these objects.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
PassInGrid	Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxModelsInGrid	Number of models to test from grid options
MaxRunsWithoutNewWinner	Number of models built before calling it quits
MaxRunMinutes	Maximum number of minutes to let this run

Shuffles	Number of times to randomize grid possibilities
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MetricPeriods	Number of periods to use between Catboost evaluations
Trees	Bandit grid partitioned. The maximum number of trees you want in your models
Depth	Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
L2_Leaf_Reg	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
RandomStrength	A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.
BorderCount	Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU
LearningRate	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)
RSM	CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)
BootStrapType	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")
GrowPolicy	Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, catboostgrid, and a transformation details file.

AutoCatBoostScoring *AutoCatBoostScoring*

Description

AutoCatBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions. This function requires you to supply features for scoring. It will run `ModelDataPrep()` to prepare your features for catboost data conversion and scoring.

Usage

```

AutoCatBoostScoring(
  TargetType = NULL,
  ScoringData = NULL,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  ModelObject = NULL,
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  MultiClassTargetLevels = NULL,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = TRUE,
  MDP_CharToFactor = TRUE,
  MDP_RemoveDates = TRUE,
  MDP_MissFactor = "0",
  MDP_MissNum = -1,
  RemoveModel = FALSE
)

```

Arguments

TargetType	Set this value to "regression", "classification", or "multiclass" to score models built using AutoCatBoostRegression(), AutoCatBoostClassify() or AutoCatBoostMultiClass().
ScoringData	This is your data.table of features for scoring. Can be a single row or batch.
FeatureColumnNames	Supply either column names or column numbers used in the AutoCatBoostRegression() function
IDcols	Supply ID column numbers for any metadata you want returned with your predicted values
ModelObject	Supply the model object directly for scoring instead of loading it from file. If you supply this, ModelID and ModelPath will be ignored.
ModelPath	Supply your path file used in the AutoCatBoost__() function
ModelID	Supply the model ID used in the AutoCatBoost__() function
ReturnFeatures	Set to TRUE to return your features with the predicted values.
MultiClassTargetLevels	For use with AutoCatBoostMultiClass(). If you saved model objects then this scoring function will locate the target levels file. If you did not save model objects, you can supply the target levels returned from AutoCatBoostMultiClass().
TransformNumeric	Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.
BackTransNumeric	Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.
TargetColumnName	Input your target column name used in training if you are utilizing the transformation service
TransformationObject	Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file.
TransID	Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().
TransPath	Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.
MDP_Impute	Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function
MDP_CharToFactor	Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function
MDP_RemoveDates	Set to TRUE if you have date of timestamp columns in your ScoringData
MDP_MissFactor	If you set MDP_Impute to TRUE, supply the character values to replace missing values with
MDP_MissNum	If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with
RemoveModel	Set to TRUE if you want the model removed immediately after scoring

Value

A data.table of predicted values with the option to return model features as well.

AutoCatBoostSizeFreqDist

AutoCatBoostSizeFreqDist

Description

AutoCatBoostSizeFreqDist for building size and frequency distributions via quantile regressions. Size (or severity) and frequency (or count) quantile regressions are build. Use this with the Auto-QuantileGibbsSampler function to simulate the joint distribution.

Usage

```

AutoCatBoostSizeFreqDist(
  CountData = NULL,
  SizeData = NULL,
  CountQuantiles = seq(0.1, 0.9, 0.1),
  SizeQuantiles = seq(0.1, 0.9, 0.1),
  AutoTransform = TRUE,
  DataPartitionRatios = c(0.75, 0.2, 0.05),
  StratifyColumnNames = NULL,
  NTrees = 1500,
  TaskType = "GPU",
  EvalMetric = "Quantile",
  GridTune = FALSE,
  GridEvalMetric = "mae",
  CountTargetColumnName = NULL,
  SizeTargetColumnName = NULL,
  CountFeatureColNames = NULL,
  SizeFeatureColNames = NULL,
  CountIDcols = NULL,
  SizeIDcols = NULL,
  ModelIDs = c("CountModel", "SizeModel"),
  MaxModelsGrid = 5,
  ModelPath = NULL,
  MetaDataPath = NULL,
  NumOfParDepPlots = 0
)

```

Arguments

CountData	This is your CountData generated from the IntermittentDemandBootStrapper() function
SizeData	This is your SizeData generated from the IntermittentDemandBootStrapper() function
CountQuantiles	The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.
SizeQuantiles	The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.
AutoTransform	Set to FALSE not to have the your target variables automatically transformed for the best normalization.
DataPartitionRatios	The default is c(0.75,0.20,0.05). With CatBoost, you should allocate a decent amount to the validation data (second input). Three inputs are required.
StratifyColumnNames	Specify grouping variables to stratify by
NTrees	Default is 1500. If the best model utilizes all trees, you should consider increasing the argument.
TaskType	The default is set to "GPU". If you do not have a GPU, set it to "CPU".
EvalMetric	Set to "Quantile". Alternative quantile methods may become available in the future.

GridTune	The default is set to FALSE. If you set to TRUE, make sure to specify MaxModelsGrid to a number greater than 1.
GridEvalMetric	The default is set to "mae". Choose from 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'.
CountTargetColumnName	Column names or column numbers
SizeTargetColumnName	Column names or column numbers
CountFeatureColNames	Column names or column numbers
SizeFeatureColNames	Column names or column numbers
CountIDcols	Column names or column numbers
SizeIDcols	Column names or column numbers
ModelIDs	A two element character vector. E.g. c("CountModel","SizeModel")
MaxModelsGrid	Set to a number greater than 1 if GridTune is set to TRUE
ModelPath	This path file is where all your models will be stored. If you leave MetaDataPath NULL, the evaluation metadata will also be stored here. If you leave this NULL, the function will not run.
MetaDataPath	A separate path to store the model metadata for evaluation.
NumOfParDepPlots	Set to a number greater than or equal to 1 to see the relationships between your features and targets.

Value

This function does not return anything. It can only store your models and model evaluation metadata to file.

AutoDataDictionaries *AutoDataDictionaries*

Description

AutoDataDictionaries is a function to return data dictionary data in table form

Usage

```

AutoDataDictionaries(
  Type = "sqlserver",
  DBConnection,
  DDType = 1L,
  Query = NULL,
  ASIS = FALSE,
  CloseChannel = TRUE
)

```

Arguments

Type	= "sqlserver" is currently the only system supported
DBConnection	This is a RODBC connection object for sql server
DDType	Select from 1 - 6 based on this article
Query	Supply a query
ASIS	Set to TRUE to pull in values without coercing types
CloseChannel	Set to TRUE to disconnect

AutoDataPartition	<i>AutoDataPartition</i>
-------------------	--------------------------

Description

This function will take your ratings matrix and model and score your data in parallel.

Usage

```
AutoDataPartition(
  data,
  NumDataSets = 3L,
  Ratios = c(0.7, 0.2, 0.1),
  PartitionType = "random",
  StratifyColumnNames = NULL,
  StratifyNumericTarget = NULL,
  StratTargetPrecision = 3L,
  TimeColumnName = NULL
)
```

Arguments

<code>data</code>	Source data to do your partitioning on
<code>NumDataSets</code>	The number of total data sets you want built
<code>Ratios</code>	A vector of values for how much data each data set should get in each split. E.g. <code>c(0.70, 0.20, 0.10)</code>
<code>PartitionType</code>	Set to either "random", "timeseries", or "time". With "random", your data will be partitioned randomly (with stratified sampling if column names are supplied). With "timeseries", you can partition by time with a stratify option (so long as you have an equal number of records for each strata). With "time" you will have data sets generated so that the training data contains the earliest records in time, validation data the second earliest, test data the third earliest, etc.
<code>StratifyColumnNames</code>	Supply column names of categorical features to use in a stratified sampling procedure for partitioning the data. Partition type must be "random" to use this option
<code>StratifyNumericTarget</code>	Supply a column name that is numeric. Use for "random" PartitionType, you can stratify your numeric variable by splitting up based on percRank to ensure a proper allocation of extreme values in your created data sets.
<code>StratTargetPrecision</code>	For "random" PartitionType and when StratifyNumericTarget is not null, precision will be the number of decimals used in the percentile calculation. If you supply a value of 1, deciles will be used. For a value of 2, percentiles will be used. Larger values are supported.
<code>TimeColumnName</code>	Supply a date column name or a name of a column with an ID for sorting by time such that the smallest number is the earliest in time.

Value

Returns a list of data.tables

  NumDataSets = 3L,
  Ratios = c(0.70,0.20,0.10),
  PartitionType = "random",
  StratifyColumnNames = NULL,
  StratifyNumericTarget = NULL,
  StratTargetPrecision = 1L,
  TimeColumnName = NULL)

# Collect data
TrainData <- dataSets$TrainData
ValidationData <- dataSets$ValidationData
TestData <- dataSets$TestData
```

AutoFourierFeatures *AutoFourierFeatures*

Description

```
#' AutoFourierFeatures
```

Usage

```

AutoFourierFeatures(
  data,
  FourierPairs = NULL,
  FCPeriods = NULL,
  Time_Unit = NULL,
  TargetColumn = NULL,
  DateColumn = NULL,
  GroupVariable = NULL,
  xregs = NonGroupDateNames
)

```

Arguments

<code>data</code>	The source data
<code>FourierPairs</code>	A number indicating the max number of fourier pairs that will be built
<code>FCPeriods</code>	Number of periods
<code>Time_Unit</code>	Agg level
<code>TargetColumn</code>	The name of your target column
<code>DateColumn</code>	The name of your date column
<code>GroupVariable</code>	The name of your group variable
<code>xregs</code>	Extra data to merge in

AutoH2oDRFCARMA	<i>AutoH2oDRFCARMA Automated CatBoost Calendar, Holiday, ARMA, and Trend Variables Forecasting</i>
-----------------	--

Description

AutoH2oDRFCARMA Automated CatBoost Calendar, Holiday, ARMA, and Trend Variables Forecasting. Create hundreds of thousands of time series forecasts using this function.

Usage

```

AutoH2oDRFCARMA(
  data,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,

```

```

GroupVariables = NULL,
FC_Periods = 30,
TimeUnit = "week",
TimeGroups = c("weeks", "months"),
TargetTransformation = FALSE,
Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
XREGS = NULL,
Lags = c(1:5),
MA_Periods = c(1:5),
SD_Periods = NULL,
Skew_Periods = NULL,
Kurt_Periods = NULL,
Quantile_Periods = NULL,
Quantiles_Selected = NULL,
Difference = TRUE,
FourierTerms = 6,
CalendarVariables = FALSE,
HolidayVariable = TRUE,
HolidayLags = 1,
HolidayMovingAverages = 1:2,
TimeTrendVariable = FALSE,
DataTruncate = FALSE,
ZeroPadSeries = NULL,
SplitRatios = c(0.7, 0.2, 0.1),
EvalMetric = "MAE",
GridTune = FALSE,
ModelCount = 1,
NTrees = 1000,
PartitionType = "timeseries",
MaxMem = "32G",
NThreads = max(1, parallel::detectCores() - 2),
Timer = TRUE,
DebugMode = FALSE
)

```

Arguments

<code>data</code>	Supply your full series data set here
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>TargetColumnName</code>	List the column name of your target variables column. E.g. "Target"
<code>DateColumnName</code>	List the column name of your date column. E.g. "DateTime"
<code>HierarchGroups</code>	Vector of hierachy categorical columns.
<code>GroupVariables</code>	Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.
<code>FC_Periods</code>	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
<code>TimeUnit</code>	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
<code>TimeGroups</code>	Select time aggregations for adding various time aggregated GDL features.

TargetTransformation	Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
Methods	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
XREGS	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.
Lags	Select the periods for all lag variables you want to create. E.g. c(1:5,52)
MA_Periods	Select the periods for all moving average variables you want to create. E.g. c(1:5,52)
SD_Periods	Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)
Skew_Periods	Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)
Kurt_Periods	Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)
Quantile_Periods	Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)
Quantiles_Selected	Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q60")
Difference	Puts the I in ARIMA for single series and grouped series.
FourierTerms	Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.
CalendarVariables	Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year
HolidayVariable	Set to TRUE to have a holiday counter variable created.
HolidayLags	Number of lags to build off of the holiday count variable.
HolidayMovingAverages	Number of moving averages to build off of the holiday count variable.
TimeTrendVariable	Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.
DataTruncate	Set to TRUE to remove records with missing values from the lags and moving average features created
ZeroPadSeries	Set to "all", "inner", or NULL. See TimeSeriesFill for explanation
SplitRatios	E.g c(0.7,0.2,0.1) for train, validation, and test sets
EvalMetric	Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"

GridTune	Set to TRUE to run a grid tune
ModelCount	Set the number of models to try in the grid tune
NTrees	Select the number of trees you want to have built to train the model
PartitionType	Select "random" for random data partitioning "time" for partitioning by time frames
MaxMem	Set to the maximum amount of memory you want to allow for running this function. Default is "32G".
NThreads	Set to the number of threads you want to dedicate to this function.
Timer	Set to FALSE to turn off the updating print statements for progress
DebugMode	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

## End(Not run)

```

Description

AutoH2oDRFClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

Usage

```
AutoH2oDRFClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "auc",
  Trees = 50L,
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TargetColumnName</code>	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 1 numeric variable.
<code>FeatureColNames</code>	Either supply the feature column names OR the column number where the target is located (but not mixed types)

eval_metric	This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"
Trees	The maximum number of trees you want in your models
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set the number of threads you want to dedicate to the model building
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shutdown H2O after running the function
HurdleModel	Leave it set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoH2oDRFHurdleModel *AutoH2oDRFHurdleModel is generalized hurdle modeling framework*

Description

AutoH2oDRFHurdleModel is generalized hurdle modeling framework

Usage

```

AutoH2oDRFHurdleModel(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,

```

```

    TargetColumnName = NULL,
    FeatureColNames = NULL,
    TransformNumericColumns = NULL,
    SplitRatios = c(0.7, 0.2, 0.1),
    ModelID = "ModelTest",
    Paths = NULL,

    SaveModelObjects = TRUE,
    IfSaveModel = "mojo",
    MaxMem = "28G",
    NThreads = max(1L, parallel::detectCores() - 2L),
    Trees = 1000L,
    GridTune = TRUE,
    MaxModelsInGrid = 1L,
    NumOfParDepPlots = 10L,
    PassInGrid = NULL
  )

```

Arguments

data	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
TrainOnFull	Set to TRUE to train on full data
ValidationData	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
TestData	Source test data. Do not include a column that has the class labels for the buckets as they are created internally.
Buckets	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
TargetColumnName	Supply the column name or number for the target variable
FeatureColNames	Supply the column names or number of the features (not included the Primary-DateColumn)
TransformNumericColumns	Transform numeric column inside the AutoCatBoostRegression() function
SplitRatios	Supply vector of partition ratios. For example, c(0.70,0.20,0.10).
ModelID	Define a character name for your models
Paths	The path to your folder where you want your model information saved
MetaDataPaths	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.
SaveModelObjects	Set to TRUE to save the model objects to file in the folders listed in Paths
IfSaveModel	Save as "mojo" or "standard"
MaxMem	Set the maximum memory your system can provide
NThreads	Set the number of threads you want to dedicate to the model building
Trees	Default 1000

GridTune	Set to TRUE if you want to grid tune the models
MaxModelsInGrid	Set to a numeric value for the number of models to try in grid tune
NumOfParDepPlots	Set to pull back N number of partial dependence calibration plots.
PassInGrid	Pass in a grid for changing up the parameter settings for catboost

Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, Validation-Data.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).

FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
eval_metric	This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"
Trees	The maximum number of trees you want in your models
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set the number of threads you want to dedicate to the model building
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to have H2O shutdown after running this function
HurdleModel	Leave set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

AutoH2oDRFRegression	<i>AutoH2oDRFRegression is an automated H2O modeling framework with grid-tuning and model evaluation</i>
----------------------	--

Description

AutoH2oDRFRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```

AutoH2oDRFRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,

```

```

TransformNumericColumns = NULL,
Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
eval_metric = "RMSE",
Trees = 50,
GridTune = FALSE,
MaxMem = "32G",
NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TargetColumnName</code>	Either supply the target column name OR the column number where the target is located (but not mixed types).
<code>FeatureColNames</code>	Either supply the feature column names OR the column number where the target is located (but not mixed types)
<code>TransformNumericColumns</code>	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
<code>Methods</code>	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
<code>eval_metric</code>	This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"
<code>Trees</code>	The maximum number of trees you want in your models
<code>GridTune</code>	Set to TRUE to run a grid tuning procedure. Set a number in <code>MaxModelsInGrid</code> to tell the procedure how many models you want to test.
<code>MaxMem</code>	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
<code>NThreads</code>	Set the number of threads you want to dedicate to the model building
<code>MaxModelsInGrid</code>	Number of models to test from grid options (1080 total possible options)

<code>model_path</code>	A character string of your path file to where you want your output saved
<code>metadata_path</code>	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to <code>model_path</code> .
<code>ModelID</code>	A character string to name your model and output
<code>NumOfParDepPlots</code>	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
<code>ReturnModelObjects</code>	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
<code>SaveModelObjects</code>	Set to TRUE to return all modeling objects to your environment
<code>IfSaveModel</code>	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
<code>H2OShutdown</code>	For use in other functions.
<code>HurdleModel</code>	Leave it set to FALSE

Value

Saves to file and returned in list: `VariableImportance.csv`, `Model`, `ValidationData.csv`, `Evaluation-Plot.png`, `EvaluationBoxPlot.png`, `EvaluationMetrics.csv`, `ParDepPlots.R` a named list of features with partial dependence calibration plots, `ParDepBoxPlots.R`, `GridCollect`, `GridList`, and Transformation metadata

AutoH2oGBMCARMA

AutoH2oGBMCARMA

Description

AutoH2oGBMCARMA Multivariate Forecasting with alendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```

AutoH2oGBMCARMA(
  data,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,
  GroupVariables = NULL,
  FC_Periods = 30,
  TimeUnit = "week",
  TimeGroups = c("weeks", "months"),

```

```

    TargetTransformation = FALSE,
    Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
    XREGS = NULL,
    Lags = c(1:5),
    MA_Periods = c(1:5),
    SD_Periods = c(2:5),
    Skew_Periods = c(3:5),
    Kurt_Periods = c(4:5),
    Quantile_Periods = c(3:5),
    Quantiles_Selected = c("q5", "q95"),
    Difference = TRUE,
    FourierTerms = 6,
    CalendarVariables = FALSE,
    HolidayVariable = TRUE,
    HolidayLags = 1,
    HolidayMovingAverages = 1:2,
    TimeTrendVariable = FALSE,
    ZeroPadSeries = NULL,
    DataTruncate = FALSE,
    SplitRatios = c(0.7, 0.2, 0.1),
    MaxMem = "28G",
    NThreads = max(1L, parallel::detectCores() - 2L),
    EvalMetric = "RMSE",
    GridTune = FALSE,
    GridEvalMetric = "mae",
    ModelCount = 1,
    NTrees = 1000,
    PartitionType = "timeseries",
    Timer = TRUE,
    DebugMode = FALSE
)

```

Arguments

<code>data</code>	Supply your full series data set here
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>TargetColumnName</code>	List the column name of your target variables column. E.g. "Target"
<code>DateColumnName</code>	List the column name of your date column. E.g. "DateTime"
<code>HierarchGroups</code>	Vector of hierachy categorical columns.
<code>GroupVariables</code>	Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.
<code>FC_Periods</code>	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
<code>TimeUnit</code>	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
<code>TimeGroups</code>	Select time aggregations for adding various time aggregated GDL features.
<code>TargetTransformation</code>	Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. See the <code>Methods</code> argument for a listing of methods.

Methods	Target transformation methods to test Tests YeoJohnson, BoxCox, Log, Log plus one, and Asigh (also Asin and Logit for proportion target variables).
XREGS	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.
Lags	Select the periods for all lag variables you want to create. E.g. c(1:5,52)
MA_Periods	Select the periods for all moving average variables you want to create. E.g. c(1:5,52)
SD_Periods	Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)
Skew_Periods	Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)
Kurt_Periods	Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)
Quantile_Periods	Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)
Quantiles_Selected	Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q60")
Difference	Puts the I in ARIMA for single series and grouped series.
FourierTerms	Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.
CalendarVariables	Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year
HolidayVariable	Set to TRUE to have a holiday counter variable created.
HolidayLags	Number of lags to build off of the holiday count variable.
HolidayMovingAverages	Number of moving averages to build off of the holiday count variable.
TimeTrendVariable	Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.
ZeroPadSeries	Set to "all", "inner", or NULL. See TimeSeriesFill for explanation
DataTruncate	Set to TRUE to remove records with missing values from the lags and moving average features created
SplitRatios	E.g c(0.7,0.2,0.1) for train, validation, and test sets
MaxMem	Set to the maximum amount of memory you want to allow for running this function. Default is "32G".
NThreads	Set to the number of threads you want to dedicate to this function.
EvalMetric	Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"
GridTune	Set to TRUE to run a grid tune

GridEvalMetric	This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'
ModelCount	Set the number of models to try in the grid tune
NTrees	Select the number of trees you want to have built to train the model
PartitionType	Select "random" for random data partitioning "time" for partitioning by time frames
Timer	Set to FALSE to turn off the updating print statements for progress
DebugMode	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the h2o-gbm model objects (everything returned from AutoH2oGBMRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

Description

AutoH2oGBMClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

Usage

```
AutoH2oGBMClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "auc",
  Trees = 50L,
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1L, parallel::detectCores() - 2L),
  MaxModelsInGrid = 2L,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TargetColumnName</code>	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 1 numeric variable.
<code>FeatureColNames</code>	Either supply the feature column names OR the column number where the target is located (but not mixed types)

eval_metric	This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"
Trees	The maximum number of trees you want in your models
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set to the number of threads you want to use for running this function
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shut down H2O after running the function
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoH2oGBMFreqSizeScoring

*AutoH2oGBMFreqSizeScoring is for scoring the models build with
AutoH2oGBMSizeFreqDist()*

Description

AutoH2oGBMFreqSizeScoring is for scoring the models build with AutoH2oGBMSizeFreqDist(). It will return the predicted values for every quantile model for both distributions for 1 to the max forecast periods you provided to build the scoring data.

Usage

```
AutoH2oGBMFreqSizeScoring(
```

```

    ScoringData,
    TargetColumnNames = NULL,
    CountQuantiles = seq(0.1, 0.9, 0.1),
    SizeQuantiles = seq(0.1, 0.9, 0.1),
    ModelPath = NULL,
    ModelIDs = c("CountModel", "SizeModel"),
    JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
    KeepFeatures = TRUE
  )

```

Arguments

ScoringData	The scoring data returned from <code>IntermittentDemandScoringDataGenerator()</code>
TargetColumnNames	A character or numeric vector of the target names. E.g. <code>c("Counts", "TARGET_qty")</code>
CountQuantiles	A numerical vector of the quantiles used in model building
SizeQuantiles	A numerical vector of the quantiles used in model building
ModelPath	The path file to where you models were saved
ModelIDs	The ID's used in model building
JavaOptions	For mojo scoring <code>'-Xmx1g -XX:ReservedCodeCacheSize=256m'</code> ,
KeepFeatures	Set to TRUE to return the features with the predicted values

Value

Returns a list of `CountData` scores, `SizeData` scores, along with count and size prediction column names

Author(s)

Adrian Antico

AutoH2oGBMHurdleModel *AutoH2oGBMHurdleModel is generalized hurdle modeling framework*

Description

AutoH2oGBMHurdleModel is generalized hurdle modeling framework

Usage

```
AutoH2oGBMHurdleModel(
  data,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  TransformNumericColumns = NULL,
  Distribution = "gaussian",
  SplitRatios = c(0.7, 0.2, 0.1),
  ModelID = "ModelTest",
  Paths = NULL,
  MetadataPaths = NULL,
  SaveModelObjects = TRUE,
  IfSaveModel = "mojo",
  MaxMem = "28G",
  NThreads = max(1L, parallel::detectCores() - 2L),
  Trees = 1000L,
  GridTune = TRUE,
  MaxModelsInGrid = 1L,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL
)
```

Arguments

data	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
ValidationData	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
TestData	Source test data. Do not include a column that has the class labels for the buckets as they are created internally.
Buckets	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
TargetColumnName	Supply the column name or number for the target variable
FeatureColNames	Supply the column names or number of the features (not included the Primary-DateColumn)

TransformNumericColumns	Transform numeric column inside the AutoCatBoostRegression() function
Distribution	Set to the distribution of choice based on H2O regression documents.
SplitRatios	Supply vector of partition ratios. For example, c(0.70,0.20,0.10).
ModelID	Define a character name for your models
Paths	The path to your folder where you want your model information saved
MetaDataPaths	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.
SaveModelObjects	Set to TRUE to save the model objects to file in the folders listed in Paths
IfSaveModel	Save as "mojo" or "standard"
MaxMem	Set the maximum memory your system can provide
NThreads	Set the number of threads you want to dedicate to the model building
Trees	Default 1000
GridTune	Set to TRUE if you want to grid tune the models
MaxModelsInGrid	Set to a numeric value for the number of models to try in grid tune
NumOfParDepPlots	Set to pull back N number of partial dependence calibration plots.
PassInGrid	Pass in a grid for changing up the parameter settings for catboost

Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoH2oGBMMultiClass *AutoH2oGBMMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation*

Description

AutoH2oGBMMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, confusion matrix, and variable importance.

Usage

```
AutoH2oGBMMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "logloss",
  Trees = 50,
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.

TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
eval_metric	This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"
Trees	The maximum number of trees you want in your models
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set to the number of threads you want to use for running this function
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shutdown H2O when done with function
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TargetColumnName</code>	Either supply the target column name OR the column number where the target is located (but not mixed types).
<code>FeatureColNames</code>	Either supply the feature column names OR the column number where the target is located (but not mixed types)
<code>TransformNumericColumns</code>	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
<code>Methods</code>	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
<code>Alpha</code>	This is the quantile value you want to use for quantile regression. Must be a decimal between 0 and 1.

Distribution	Choose from gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber"
eval_metric	This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"
Trees	The maximum number of trees you want in your models
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set to the mamimum amount of threads you want to use for this function
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to FALSE to keep H2O running after you build your model
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and metadata

AutoH2oGBMSizeFreqDist

AutoH2oGBMSizeFreqDist for building size and frequency distributions via quantile regressions

Description

AutoH2oGBMSizeFreqDist for building size and frequency distributions via quantile regressions.

Size (or severity) and frequency (or count) quantile regressions are build. Use this with the ID_SingleLevelGibbsSampler function to simulate the joint distribution.

Usage

```
AutoH2oGBMSizeFreqDist(
  CountData = NULL,
  SizeData = NULL,
  CountQuantiles = seq(0.1, 0.9, 0.1),
  SizeQuantiles = seq(0.1, 0.9, 0.1),
  AutoTransform = TRUE,
  DataPartitionRatios = c(0.75, 0.2, 0.05),
  StratifyColumnName = NULL,
  StratifyTargets = FALSE,
  NTrees = 1500,
  MaxMem = "28G",
  NThreads = max(1, parallel::detectCores() - 2),
  EvalMetric = "Quantile",
  GridTune = FALSE,
  CountTargetColumnName = NULL,
  SizeTargetColumnName = NULL,
  CountFeatureColNames = NULL,
  SizeFeatureColNames = NULL,
  ModelIDs = c("CountModel", "SizeModel"),
  MaxModelsGrid = 5,
  ModelPath = NULL,
  MetaDataPath = NULL,
  NumOfParDepPlots = 0
)
```

Arguments

CountData	This is your CountData generated from the IntermittentDemandBootStrapper() function
SizeData	This is your SizeData generated from the IntermittentDemandBootStrapper() function
CountQuantiles	The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.
SizeQuantiles	The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.
AutoTransform	Set to FALSE not to have the your target variables automatically transformed for the best normalization.
DataPartitionRatios	The default is c(0.75,0.20,0.05). With CatBoost, you should allocate a decent amount to the validation data (second input). Three inputs are required.
StratifyColumnName	You can specify grouping columns to stratify by

StratifyTargets	Set to TRUE to stratify by the target variables to ensure the a more even allocation for potentially highly skewed data
NTrees	Default is 1500. If the best model utilizes all trees, you should consider increasing the argument.
MaxMem	The max memory allocation. E.g. "28G"
NThreads	The max threads to use. E.g. 4
EvalMetric	Set to "Quantile". Alternative quantile methods may become available in the future.
GridTune	The default is set to FALSE. If you set to TRUE, make sure to specify MaxModelsGrid to a number greater than 1.
CountTargetColumnName	Column names or column numbers
SizeTargetColumnName	Column names or column numbers
CountFeatureColNames	Column names or column numbers
SizeFeatureColNames	Column names or column numbers
ModelIDs	A two element character vector. E.g. c("CountModel","SizeModel")
MaxModelsGrid	Set to a number greater than 1 if GridTune is set to TRUE
ModelPath	This path file is where all your models will be stored. If you leave MetaDataPath NULL, the evaluation metadata will also be stored here. If you leave this NULL, the function will not run.
MetaDataPath	A separate path to store the model metadata for evaluation.
NumOfParDepPlots	Set to a number greater than or equal to 1 to see the relationships between your features and targets.

Value

This function does not return anything. It can only store your models and model evaluation metadata to file.

AutoH2oGLMCARMA

AutoH2oGLMCARMA

Description

AutoH2oGLMCARMA Multivariate Forecasting with alendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```

AutoH2oGLMCARMA(
  data,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,
  GroupVariables = NULL,
  FC_Periods = 30,
  TimeUnit = "week",
  TimeGroups = c("weeks", "months"),
  TargetTransformation = FALSE,
  XREGS = NULL,
  Lags = c(1:5),
  MA_Periods = c(1:5),
  SD_Periods = NULL,
  Skew_Periods = NULL,
  Kurt_Periods = NULL,
  Quantile_Periods = NULL,
  Quantiles_Selected = NULL,
  Difference = TRUE,
  FourierTerms = 2,

```

```

CalendarVariables = FALSE,
HolidayVariable = TRUE,
HolidayLags = 1,
HolidayMovingAverages = 2:3,
TimeTrendVariable = FALSE,
ZeroPadSeries = NULL,
DataTruncate = FALSE,
SplitRatios = c(0.7, 0.2, 0.1),
MaxMem = "28G",
NThreads = max(1L, parallel::detectCores() - 2L),
EvalMetric = "RMSE",
GridTune = FALSE,
GridEvalMetric = "mae",
ModelCount = 1,
PartitionType = "timeseries",
Timer = TRUE,
DebugMode = FALSE
)

```

Arguments

<code>data</code>	Supply your full series data set here
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>TargetColumnName</code>	List the column name of your target variables column. E.g. "Target"
<code>DateColumnName</code>	List the column name of your date column. E.g. "DateTime"
<code>HierarchGroups</code>	Vector of hierachy categorical columns.
<code>GroupVariables</code>	Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.
<code>FC_Periods</code>	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
<code>TimeUnit</code>	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
<code>TimeGroups</code>	Select time aggregations for adding various time aggregated GDL features.
<code>TargetTransformation</code>	Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
<code>XREGS</code>	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.
<code>Lags</code>	Select the periods for all lag variables you want to create. E.g. <code>c(1:5,52)</code>
<code>MA_Periods</code>	Select the periods for all moving average variables you want to create. E.g. <code>c(1:5,52)</code>
<code>SD_Periods</code>	Select the periods for all moving standard deviation variables you want to create. E.g. <code>c(1:5,52)</code>
<code>Skew_Periods</code>	Select the periods for all moving skewness variables you want to create. E.g. <code>c(1:5,52)</code>

Kurt_Periods	Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)
Quantile_Periods	Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)
Quantiles_Selected	Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95", "q99")
Difference	Puts the I in ARIMA for single series and grouped series.
FourierTerms	Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interactions if hierarchy is enabled.
CalendarVariables	Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year
HolidayVariable	Set to TRUE to have a holiday counter variable created.
HolidayLags	Number of lags to build off of the holiday count variable.
HolidayMovingAverages	Number of moving averages to build off of the holiday count variable.
TimeTrendVariable	Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.
ZeroPadSeries	Set to "all", "inner", or NULL. See TimeSeriesFill for explanation
DataTruncate	Set to TRUE to remove records with missing values from the lags and moving average features created
SplitRatios	E.g c(0.7,0.2,0.1) for train, validation, and test sets
MaxMem	Set to the maximum amount of memory you want to allow for running this function. Default is "32G".
NThreads	Set to the number of threads you want to dedicate to this function.
EvalMetric	Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"
GridTune	Set to TRUE to run a grid tune
GridEvalMetric	This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'
ModelCount	Set the number of models to try in the grid tune
PartitionType	Select "random" for random data partitioning "time" for partitioning by time frames
Timer	Set to FALSE to turn off the updating print statements for progress
DebugMode	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the h2o-gbm model objects (everything returned from AutoH2oGBMRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoH2oGLMClassifier *AutoH2oGLMClassifier is an automated H2O modeling framework with grid-tuning and model evaluation*

Description

AutoH2oGLMClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

Usage

```

AutoH2oGLMClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  Distribution = "binomial",
  link = NULL,
  eval_metric = "auc",
  GridTune = FALSE,
  MaxMem = "32G",

```

```

NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = FALSE,
HurdleModel = FALSE
)

```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TargetColumnName</code>	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 1 numeric variable.
<code>FeatureColNames</code>	Either supply the feature column names OR the column number where the target is located (but not mixed types)
<code>Distribution</code>	"binomial", "quasibinomial"
<code>link</code>	identity, logit, log, inverse, tweedie
<code>eval_metric</code>	This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"
<code>GridTune</code>	Set to TRUE to run a grid tuning procedure. Set a number in <code>MaxModelsInGrid</code> to tell the procedure how many models you want to test.
<code>MaxMem</code>	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
<code>NThreads</code>	Set the number of threads you want to dedicate to the model building
<code>MaxModelsInGrid</code>	Number of models to test from grid options (1080 total possible options)
<code>model_path</code>	A character string of your path file to where you want your output saved
<code>metadata_path</code>	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to <code>model_path</code> .
<code>ModelID</code>	A character string to name your model and output
<code>NumOfParDepPlots</code>	Tell the function the number of partial dependence calibration plots you want to create.
<code>ReturnModelObjects</code>	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shutdown H2O after running the function
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoH2oGLMMultiClass	<i>AutoH2oGLMMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation</i>
----------------------	--

Description

AutoH2oGLMMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, confusion matrix, and variable importance.

Usage

```
AutoH2oGLMMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "logloss",
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
eval_metric	This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set the number of threads you want to dedicate to the model building
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to have H2O shutdown after running this function
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

AutoH2oGLMRegression	<i>AutoH2oGLMRegression is an automated H2O modeling framework with grid-tuning and model evaluation</i>
----------------------	--

Description

AutoH2oGLMRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```

AutoH2oGLMRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  Distribution = "binomial",
  link = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),

```

```

eval_metric = "RMSE",
GridTune = FALSE,
MaxMem = "32G",
NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
Distribution	"binomial", "quasibinomial"
link	identity, logit, log, inverse, tweedie
TransformNumericColumns	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
Methods	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
eval_metric	This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set the number of threads you want to dedicate to the model building
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved

metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	For use in other functions.
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

AutoH2oMLCARMA

AutoH2oMLCARMA

Description

AutoH2oMLCARMA Multivariate Forecasting with alendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```

AutoH2oMLCARMA(
  data,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,
  GroupVariables = NULL,
  FC_Periods = 30,
  TimeUnit = "week",
  TimeGroups = c("weeks", "months"),
  TargetTransformation = FALSE,

```

```

XREGS = NULL,
Lags = c(1:5),
MA_Periods = c(1:5),
SD_Periods = NULL,
Skew_Periods = NULL,
Kurt_Periods = NULL,
Quantile_Periods = NULL,
Quantiles_Selected = NULL,
Difference = FALSE,
FourierTerms = 6,
CalendarVariables = TRUE,
HolidayVariable = TRUE,
HolidayLags = 1,
HolidayMovingAverages = 1:2,
TimeTrendVariable = FALSE,
ZeroPadSeries = NULL,
DataTruncate = FALSE,
SplitRatios = c(0.7, 0.2, 0.1),
Trees = 500,
MaxMem = "28G",
NThreads = max(1L, parallel::detectCores() - 2L),
EvalMetric = "RMSE",
GridTune = FALSE,
ModelCount = 1,
PartitionType = "timeseries",
Timer = TRUE,
DebugMode = FALSE
)

```

Arguments

<code>data</code>	Supply your full series data set here
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>TargetColumnName</code>	List the column name of your target variables column. E.g. "Target"
<code>DateColumnName</code>	List the column name of your date column. E.g. "DateTime"
<code>HierarchGroups</code>	Vector of hierachy categorical columns.
<code>GroupVariables</code>	Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.
<code>FC_Periods</code>	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
<code>TimeUnit</code>	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
<code>TimeGroups</code>	Select time aggregations for adding various time aggregated GDL features.
<code>TargetTransformation</code>	Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
<code>XREGS</code>	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

Lags	Select the periods for all lag variables you want to create. E.g. c(1:5,52)
MA_Periods	Select the periods for all moving average variables you want to create. E.g. c(1:5,52)
SD_Periods	Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)
Skew_Periods	Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)
Kurt_Periods	Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)
Quantile_Periods	Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)
Quantiles_Selected	Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60")
Difference	Puts the I in ARIMA for single series and grouped series.
FourierTerms	Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.
CalendarVariables	Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year
HolidayVariable	Set to TRUE to have a holiday counter variable created.
HolidayLags	Number of lags to build off of the holiday count variable.
HolidayMovingAverages	Number of moving averages to build off of the holiday count variable.
TimeTrendVariable	Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.
ZeroPadSeries	Set to "all", "inner", or NULL. See TimeSeriesFill for explanation
DataTruncate	Set to TRUE to remove records with missing values from the lags and moving average features created
SplitRatios	E.g c(0.7,0.2,0.1) for train, validation, and test sets
Trees	For tree models
MaxMem	Set to the maximum amount of memory you want to allow for running this function. Default is "32G".
NThreads	Set to the number of threads you want to dedicate to this function.
EvalMetric	Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"
GridTune	Keep set to FALSE. I need to investigate how to do this more efficiently with this function
ModelCount	Number of models
PartitionType	Select "random" for random data partitioning "time" for partitioning by time frames
Timer	Set to FALSE to turn off the updating print statements for progress
DebugMode	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the h2o-gbm model objects (everything returned from AutoH2oGBMRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

)

```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
<code>TargetColumnName</code>	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 1 numeric variable.
<code>FeatureColNames</code>	Either supply the feature column names OR the column number where the target is located (but not mixed types)
<code>ExcludeAlgos</code>	"DRF", "GLM", "XGBoost", "GBM", "DeepLearning" and "StackedEnsemble"
<code>eval_metric</code>	This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"
<code>Trees</code>	The maximum number of trees you want in your models
<code>MaxMem</code>	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
<code>NThreads</code>	Set the number of threads you want to dedicate to the model building
<code>MaxModelsInGrid</code>	Number of models to test from grid options (1080 total possible options)
<code>model_path</code>	A character string of your path file to where you want your output saved
<code>metadata_path</code>	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
<code>ModelID</code>	A character string to name your model and output

NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shutdown H2O after running the function
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
ExcludeAlgos	"DRF","GLM","XGBoost","GBM","DeepLearning" and "StackedEnsemble"
eval_metric	This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"
Trees	The maximum number of trees you want in your models
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set the number of threads you want to dedicate to the model building
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to have H2O shutdown after running this function
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

AutoH2oMLRegression	<i>AutoH2oMLRegression is an automated H2O modeling framework with grid-tuning and model evaluation</i>
---------------------	---

Description

AutoH2oMLRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoH2oMLRegression(
  data,
```

```

TrainOnFull = FALSE,
ValidationData = NULL,
TestData = NULL,
TargetColumnName = NULL,
FeatureColNames = NULL,
ExcludeAlgos = NULL,
TransformNumericColumns = NULL,
Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
eval_metric = "RMSE",
Trees = 50,
MaxMem = "32G",
NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
ExcludeAlgos	"DRF","GLM","XGBoost","GBM","DeepLearning" and "StackedEnsemble"
TransformNumericColumns	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
Methods	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
eval_metric	This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"
Trees	The maximum number of trees you want in your models

MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set the number of threads you want to dedicate to the model building
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	For use in other functions.
HurdleModel	Set to FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

AutoH2OMLScoring

AutoH2OMLScoring is an automated scoring function that compliments the AutoH2o model training functions.

Description

AutoH2OMLScoring is an automated scoring function that compliments the AutoH2oGBM__() and AutoH2oDRF__() models training functions. This function requires you to supply features for scoring. It will run ModelDataPrep() to prepare your features for H2O data conversion and scoring.

Usage

```

AutoH2OMLScoring(
  ScoringData = NULL,
  ModelObject = NULL,
  ModelType = "mojo",
  H2OShutdown = TRUE,
  MaxMem = "28G",
  NThreads = max(1, parallel::detectCores() - 2),
  JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = TRUE,
  MDP_CharToFactor = TRUE,

```

```

MDP_RemoveDates = TRUE,
MDP_MissFactor = "0",
MDP_MissNum = -1
)

```

Arguments

ScoringData	This is your data.table of features for scoring. Can be a single row or batch.
ModelObject	Supply a model object from AutoH2oDRF__()
ModelType	Set to either "mojo" or "standard" depending on which version you saved
H2OShutdown	Set to TRUE is you are scoring a "standard" model file and you aren't planning on continuing to score.
MaxMem	Set to you dedicated amount of memory. E.g. "28G"
NThreads	Default set to max(1, parallel::detectCores()-2)
JavaOptions	Change the default to your machines specification if needed. Default is '-Xmx1g-XX:ReservedCodeCacheSize=256m',
ModelPath	Supply your path file used in the AutoH2o__() function
ModelID	Supply the model ID used in the AutoH2o__() function
ReturnFeatures	Set to TRUE to return your features with the predicted values.
TransformNumeric	Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.
BackTransNumeric	Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.
TargetColumnName	Input your target column name used in training if you are utilizing the transformation service
TransformationObject	Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file.
TransID	Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().
TransPath	Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.
MDP_Impute	Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function
MDP_CharToFactor	Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function
MDP_RemoveDates	Set to TRUE if you have date of timestamp columns in your ScoringData
MDP_MissFactor	If you set MDP_Impute to TRUE, supply the character values to replace missing values with
MDP_MissNum	If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with

Value

A data.table of predicted values with the option to return model features as well.

  MDP_MissFactor = "0",
  MDP_MissNum = -1)

## End(Not run)
```

Description

Steps in the function include: See details below for information on using this function.

Usage

```
AutoH2OModeler(
  Construct,
  max_memory = "28G",
  ratios = 0.8,
```

```

    BL_Trees = 500,
    nthreads = 1,
    model_path = NULL,
    MaxRuntimeSeconds = 3600,
    MaxModels = 30,
    TrainData = NULL,
    TestData = NULL,
    SaveToFile = FALSE,
    ReturnObjects = TRUE
)

```

Arguments

Construct	Core instruction file for automation (see Details below for more information on this)
max_memory	The ceiling amount of memory H2O will utilize
ratios	The percentage of train samples from source data (remainder goes to validation set)
BL_Trees	The number of trees to build in baseline GBM or RandomForest
nthreads	Set the number of threads to run function
model_path	Directory path for where you want your models saved
MaxRuntimeSeconds	Number of seconds of run time for grid tuning
MaxModels	Number of models you'd like to have returned
TrainData	Set to NULL or supply a data.table for training data
TestData	Set to NULL or supply a data.table for validation data
SaveToFile	Set to TRUE to save models and output to model_path
ReturnObjects	Set to TRUE to return objects from function

Details

1. Logic: Error checking in the modeling arguments from your Construction file
2. ML: Build grid-tuned models and baseline models for comparison and checks which one performs better on validation data
3. Evaluation: Collects the performance metrics for both
4. Evaluation: Generates calibration plots (and boxplots for regression) for the winning model
5. Evaluation: Generates partial dependence calibration plots (and boxplots for regression) for the winning model
6. Evaluation: Generates variable importance tables and a table of non-important features
7. Production: Creates a storage file containing: model name, model path, grid tune performance, baseline performance, and threshold (if classification) and stores that file in your model_path location

The Construct file must be a data.table and the columns need to be in the correct order (see examples). Character columns must be converted to type "Factor". You must remove date columns or convert them to "Factor". For classification models, your target variable needs to be a (0,1) of type "Factor." See the examples below for help with setting up the Construct file for various modeling target variable types. There are examples for regression, classification, multinomial, and quantile

regression. For help on which parameters to use, look up the r/h2o documentation. If you misspecify the construct file, it will produce an error and outpufle of what was wrong and suggestions for fixing the error.

Let's go over the construct file, column by column. The Targets column is where you specify the column number of your target variable (in quotes, e.g. "c(1)").

The Distribution column is where you specify the distribution type for the modeling task. For classification use bernoulli, for multilabel use multinomial, for quantile use quantile, and for regression, you can choose from the list available in the H2O docs, such as gaussian, poisson, gamma, etc. It's not set up to handle tweedie distributions currently but I can add support if there is demand.

The Loss column tells H2O which metric to use for the loss metrics. For regression, I typically use "mse", quantile regression, "mae", classification "auc", and multinomial "logloss". For deeplearning models, you need to use "quadratic", "absolute", and "crossentropy".

The Quantile column tells H2O which quantile to use for quantile regression (in decimal form).

The ModelName column is the name you wish to give your model as a prefix.

The Algorithm column is the model you wish to use: gbm, randomForest, deeplearning, AutoML, XGBoost, LightGBM.

The dataName column is the name of your data.

The TargetCol column is the column number of your target variable.

The FeatureCols column is the column numbers of your features.

The CreateDate column is for tracking your model build dates.

The GridTune column is a TRUE / FALSE column for whether you want to run a grid tune model for comparison.

The ExportValidData column is a TRUE / FALSE column indicating if you want to export the validation data.

The ParDep column is where you put the number of partial dependence calibration plots you wish to generate.

The PD_Data column is where you specify if you want to generate the partial dependence plots on "All" data, "Validate" data, or "Train" data.

The ThreshType column is for classification models. You can specify "f1", "f2", "f0point5", or "CS" for cost sensitive.

The FSC column is the feature selection column. Specify the percentage importance cutoff to create a table of "unimportant" features.

The tpProfit column is for when you specify "CS" in the ThreshType column. This is your true positive profit.

The tnProfit column is for when you specify "CS" in the ThreshType column. This is your true negative profit.

The fpProfit column is for when you specify "CS" in the ThreshType column. This is your false positive profit.

The fnProfit column is for when you specify "CS" in the ThreshType column. This is your false negative profit.

The SaveModel column is a TRUE / FALSE indicator. If you are just testing out models, set this to FALSE.

The SaveModelType column is where you specify if you want a "standard" model object saved or a "mojo" model object saved.

AutoH2OScoring

AutoH2OScoring is the complement of AutoH20Modeler.

Description

AutoH2OScoring is the complement of AutoH20Modeler. Use this for scoring models. You can score regression, quantile regression, classification, multinomial, clustering, and text models (built with the Word2VecModel function). You can also use this to score multioutcome models so long as there are two models: one for predicting the count of outcomes (a count outcome in character form) and a multinomial model on the label data. You will want to ensure you have a record for each label in your training data in (0,1) as factor form.

Usage

```

AutoH2OScoring(
  Features = data,
  GridTuneRow = c(1:3),
  ScoreMethod = "Standard",
  TargetType = rep("multinomial", 3),
  ClassVals = rep("probs", 3),
  TextType = "individual",
  TextNames = NULL,
  NThreads = 6,
  MaxMem = "28G",
  JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
  SaveToFile = FALSE,
  FilesPath = NULL,
  H20ShutDown = rep(FALSE, 3)
)

```

Arguments

Features	This is a data.table of features for scoring.
GridTuneRow	Numeric. The row numbers of grid_tuned_paths, KMeansModelFile, or Store-File containing the model you wish to score

ScoreMethod	"Standard" or "Mojo": Mojo is available for supervised models; use standard for all others
TargetType	"Regression", "Classification", "Multinomial", "MultiOutcome", "Text", "Clustering". MultiOutcome must be two multinomial models, a count model (the count of outcomes, as a character value), and the multinomial model predicting the labels.
ClassVals	Choose from "p1", "Probs", "Label", or "All" for classification and multinomial models.
TextType	"Individual" or "Combined" depending on how you build your word2vec models
TextNames	Column names for the text columns to convert to word2vec
NThreads	Number of available threads for H2O
MaxMem	Amount of memory to dedicate to H2O
JavaOptions	Modify to your machine if the default doesn't work
SaveToFile	Set to TRUE if you want your model scores saved to file.
FilePath	Set this to the folder where your models and model files are saved
H2OShutDown	TRUE to shutdown H2O after the run. Use FALSE if you will be repeatedly scoring and shutdown somewhere else in your environment.

Value

Returns a list of predicted values. Each list element contains the predicted values from a single model predict call.

```
AutoH2OTextPrepScoring
```

```
AutoH2OTextPrepScoring is for NLP scoring
```

Description

This function returns prepared tokenized data for H2O Word2VecModeler scoring

Usage

```
AutoH2OTextPrepScoring(  
  data,  
  string = NULL,  
  MaxMem = NULL,  
  NThreads = NULL,  
  StartH2O = TRUE  
)
```

Arguments

data	The text data
string	The name of the string column to prepare
MaxMem	Amount of memory you want to let H2O utilize
NThreads	The number of threads you want to let H2O utilize
StartH2O	Set to TRUE to have H2O start inside this function

AutoHierarchicalFourier

AutoHierarchicalFourier

Description

AutoHierarchicalFourier reverses the difference

Usage

```
AutoHierarchicalFourier(
  datax = data,
  xRegs = names(XREGS),
  FourierTermS = FourierTerms,
  TimeUnit = TimeUnit,
  FC_PeriodS = FC_Periods,
  TargetColumnN = TargetColumn,
  DateColumnN = DateColumnName,
  HierarchGroups = NULL,
  IndependentGroups = NULL
)
```

Arguments

datax	data
xRegs	The XREGS
FourierTermS	Number of fourier pairs
TimeUnit	Time unit
FC_PeriodS	Number of forecast periods
TargetColumnN	Target column name
DateColumnN	Date column name
HierarchGroups	Character vector of categorical columns to fully interact
IndependentGroups	Character vector of categorical columns to run independently

AutoHurdleScoring	<i>AutoHurdleScoring()</i>
-------------------	----------------------------

Description

AutoHurdleScoring() can score AutoCatBoostHurdleModel() and AutoXGBoostHurdleModel()

Usage

```
AutoHurdleScoring(
  TestData = NULL,
  Path = NULL,
  ModelID = NULL,
  ModelClass = "catboost",
  ArgList = NULL,
  ModelList = NULL
)
```

Arguments

TestData	scoring data.table
Path	Supply if ArgList is NULL or ModelList is null.
ModelID	Supply if ArgList is NULL or ModelList is null. Same as used in model training.
ModelClass	Name of model type. "catboost" is currently the only available option
ArgList	Output from the hurdle model
ModelList	Output from the hurdle model

Value

A data.table with the final predicted value, the intermediate model predictions, and your source data

AutoKMeans

*AutoKMeans Automated row clustering for mixed column types***Description**

AutoKMeans adds a column to your original data with a cluster number identifier. Uses glm (grid tune-able) and then k-means to find optimal k.

Usage

```

AutoKMeans(
  data,
  nthreads = 8,
  MaxMem = "28G",
  SaveModels = NULL,
  PathFile = NULL,
  GridTuneGLRM = TRUE,
  GridTuneKMeans = TRUE,
  glmCols = c(1:5),
  IgnoreConstCols = TRUE,
  glmFactors = 5,
  Loss = "Absolute",
  glmMaxIters = 1000,
  SVDMethod = "Randomized",
  MaxRunTimeSecs = 3600,
  KMeansK = 50,
  KMeansMetric = "totss"
)

```

Arguments

data	is the source time series data.table
nthreads	set based on number of threads your machine has available
MaxMem	set based on the amount of memory your machine has available
SaveModels	Set to "standard", "mojo", or NULL (default)
PathFile	Set to folder where you will keep the models

GridTuneGLRM	If you want to grid tune the glrm model, set to TRUE, FALSE otherwise
GridTuneKMeans	If you want to grid tune the KMeans model, set to TRUE, FALSE otherwise
glrmCols	the column numbers for the glrm
IgnoreConstCols	tell H2O to ignore any columns that have zero variance
glrmFactors	similar to the number of factors to return from PCA
Loss	set to one of "Quadratic", "Absolute", "Huber", "Poisson", "Hinge", "Logistic", "Periodic"
glrmMaxIters	max number of iterations
SVDMethod	choose from "Randomized", "GramSVD", "Power"
MaxRunTimeSecs	set the timeout for max run time
KMeansK	number of factors to test out in k-means to find the optimal number
KMeansMetric	pick the metric to identify top model in grid tune c("totss", "betweeness", "withinss")

Value

Original data.table with added column with cluster number identifier

Author(s)

Adrian Antico

AutoLagRollStats

AutoLagRollStats

Description

AutoLagRollStats Builds lags and a large variety of rolling statistics with options to generate them for hierarchical categorical interactions.

Usage

```

AutoLagRollStats(
  data,
  Targets = NULL,
  HierarchyGroups = NULL,
  IndependentGroups = NULL,
  DateColumn = NULL,
  TimeUnit = "day",
  TimeUnitAgg = "day",
  TimeGroups = "day",
  TimeBetween = NULL,
  RollOnLag1 = TRUE,
  Type = "Lag",
  SimpleImpute = TRUE,
  Lags = c(1:5),
  MA_RollWindows = c(2, 5, 10),
  SD_RollWindows = c(5, 10),
  Skew_RollWindows = c(5, 10),
  Kurt_RollWindows = c(5, 10),
  Quantile_RollWindows = c(10),
  Quantiles_Selected = c("q25", "q75"),
  Debug = FALSE
)

```

Arguments

data	A data.table you want to run the function on
Targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
HierarchyGroups	A vector of categorical column names that you want to have generate all lags and rolling stats done for the individual columns and their full set of interactions.

IndependentGroups	A vector of categorical column names that you want to have run independently of each other. This will mean that no interaction will be done.
DateColumn	The column name of your date column used to sort events over time
TimeUnit	List the time aggregation level for the time between events features, such as "hour", "day", "weeks", "months", "quarter", or "year"
TimeUnitAgg	List the time aggregation of your data that you want to use as a base time unit for your features. E.g. "raw" or "day"
TimeGroups	A vector of TimeUnits indicators to specify any time-aggregated GDL features you want to have returned. E.g. c("raw" (no aggregation is done), "hour", "day", "week", "month", "quarter", "year")
TimeBetween	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.
RollOnLag1	Set to FALSE to build rolling stats off of target columns directly or set to TRUE to build the rolling stats off of the lag-1 target
Type	List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1
Lags	A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.
MA_RollWindows	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
SD_RollWindows	A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.
Skew_RollWindows	A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.
Kurt_RollWindows	A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.
Quantile_RollWindows	A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.
Quantiles_Selected	Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95")
Debug	Set to TRUE to get a print of which steps are running

Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

Author(s)

Adrian Antico

AutoLagRollStatsScoring

AutoLagRollStatsScoring

Description

AutoLagRollStatsScoring Builds lags and a large variety of rolling statistics with options to generate them for hierarchical categorical interactions.

Usage

```

AutoLagRollStatsScoring(
  data,
  RowNumsID = "temp",
  RowNumsKeep = 1,
  Targets = NULL,
  HierarchyGroups = NULL,
  IndependentGroups = NULL,
  DateColumn = NULL,
  TimeUnit = "day",
  TimeUnitAgg = "day",
  TimeGroups = "day",
  TimeBetween = NULL,
  RollOnLag1 = 1,
  Type = "Lag",
  SimpleImpute = TRUE,
  Lags = NULL,
  MA_RollWindows = NULL,
  SD_RollWindows = NULL,
  Skew_RollWindows = NULL,
  Kurt_RollWindows = NULL,
  Quantile_RollWindows = NULL,
  Quantiles_Selected = NULL,
  Debug = FALSE
)

```

Arguments

data	A data.table you want to run the function on
RowNumsID	The name of your column used to id the records so you can specify which rows to keep
RowNumsKeep	The RowNumsID numbers that you want to keep
Targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
HierarchyGroups	A vector of categorical column names that you want to have generate all lags and rolling stats done for the individual columns and their full set of interactions.
IndependentGroups	Only supply if you do not want HierarchyGroups. A vector of categorical column names that you want to have run independently of each other. This will mean that no interaction will be done.
DateColumn	The column name of your date column used to sort events over time
TimeUnit	List the time aggregation level for the time between events features, such as "hour", "day", "weeks", "months", "quarter", or "year"
TimeUnitAgg	List the time aggregation of your data that you want to use as a base time unit for your features. E.g. "day",
TimeGroups	A vector of TimeUnits indicators to specify any time-aggregated GDL features you want to have returned. E.g. c("hour", "day", "week", "month", "quarter", "year"). STILL NEED TO ADD these '1min', '5min', '10min', '15min', '30min', '45min'
TimeBetween	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.
RollOnLag1	Set to FALSE to build rolling stats off of target columns directly or set to TRUE to build the rolling stats off of the lag-1 target
Type	List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1
Lags	A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.
MA_RollWindows	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
SD_RollWindows	A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.
Skew_RollWindows	A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.
Kurt_RollWindows	A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.
Quantile_RollWindows	A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.
Quantiles_Selected	Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95")
Debug	Set to TRUE to get a print out of which step you are on

Value

AutoLimeAid

AutoLimeAid automated lime

Description

AutoLimeAid automated lime explanations and lime model builds.

Usage

```

AutoLimeAid(
  EvalPredsData = data,
  LimeTrainingData = data,
  LimeBins = 10,
  LimeIterations = 7500,
  LimeNumFeatures = 0,
  LimeModel = NULL,
  LimeModelPath = NULL,
  LimeModelID = NULL,
  MLModel = NULL,
  MLModelPath = NULL,
  MLMetaDataPath = NULL,
  MLModelID = NULL,

```

```

ModelType = "xgboost",
TargetType = "classification",
NThreads = parallel::detectCores(),
MaxMem = "32G",
FeatureColumnNames = TestModel$ColNames,
IDcols = NULL,
FactorLevelsList = TestModel$FactorLevels,
TargetLevels = NULL,
OneHot = FALSE,
ReturnFeatures = TRUE,
TransformNumeric = FALSE,
BackTransNumeric = FALSE,
TargetColumnName = NULL,
TransformationObject = NULL,
TransID = NULL,
TransPath = NULL,
MDP_Impute = TRUE,
MDP_CharToFactor = TRUE,
MDP_RemoveDates = TRUE,
MDP_MissFactor = "0",
MDP_MissNum = -1
)

```

Arguments

EvalPredsData	Data used for interpretation. Should be the same kind of data used on ML_Scoring functions.
LimeTrainingData	Data used to train your ML model
LimeBins	Number of bins to use for bucketing numeric variables
LimeIterations	Number of lime permutations ran to generate interpretation of predicted value
LimeNumFeatures	How many features do you want to be considering for the Lime evaluation? Set to 0 to use all features
LimeModel	Supply a model if you have one available. Otherwise, provide a model path and either it will be pulling in or made and saved there.
LimeModelPath	Supply a path to where your model is located or to be stored.
LimeModelID	Provide a name for your model. If left NULL, a name will be created for you (and a new model).
MLModel	Supply the model object (except for H2O models). Can leave null.
MLModelPath	Supply a path to where your model is located. If this is supplied, the model will be pulled in from file (even if you supply a model)
MLMetaDataPath	Supply a path to where your model metadata is located (might be the same of the MLModelPath). If this is supplied, artifacts about the model will be pulled in from there.
MLModelID	The name of your model as read in the file directory
ModelType	Choose from "xgboost", "h2o", "catboost"
TargetType	For catboost models only. Select from "classification", "regression", "multi-class"

NThreads	Number of CPU threads.
MaxMem	Set the max memory you want to allocate. E.g. "32G"
FeatureColumnNames	The names of the features used in training your ML model (should be returned with the model or saved to file)
IDcols	The ID columns used in either CatBoost or XGBoost
FactorLevelsList	= TestModel\$FactorLevels,
TargetLevels	The target levels used in MultiClass models
OneHot	Replicate what you did with the model training
ReturnFeatures	TRUE or FALSE
TransformNumeric	Replicate what you did with the model training
BackTransNumeric	TRUE or FALSE. Replicate what you did with the model training.
TargetColumnName	For the transformations
TransformationObject	TRUE or FALSE. Replicate what you did with the model training.
TransID	Set to the ID used in model training.
TransPath	Same path used in model training.
MDP_Impute	Replicate what you did with the model training.
MDP_CharToFactor	Replicate what you did with the model training.
MDP_RemoveDates	Replicate what you did with the model training.
MDP_MissFactor	Replicate what you did with the model training.
MDP_MissNum	Replicate what you did with the model training.

AutoMarketBasketModel *AutoMarketBasketModel function runs a market basket analysis automatically*

Description

AutoMarketBasketModel function runs a market basket analysis automatically. It will convert your data, run the algorithm, and add on additional significance values not originally contained within.

Usage

```

AutoMarketBasketModel(
  data,
  OrderIDColumnName,
  ItemIDColumnName,
  LHS_Delimeter = ",",

```

```

Support = 0.001,
Confidence = 0.1,
MaxLength = 2,
MinLength = 2,
MaxTime = 5
)

```

Arguments

data	This is your transactions data set
OrderIDColumnName	Supply your column name for the Order ID Values
ItemIDColumnName	Supply your column name for the Item ID Values
LHS_Delimiter	Default delimiter for separating multiple ItemID's is a comma.
Support	Threshold for inclusion using support
Confidence	Threshold for inclusion using confidence
MaxLength	Maximum combinations of Item ID (number of items in basket to consider)
MinLength	Minimum length of combinations of ItemID (number of items in basket to consider)
MaxTime	Max run time per iteration (default is 5 seconds)

```

AutoNLS

*AutoNLS is a function for automatically building nls models***Description**

This function will build models for 9 different nls models, along with a non-parametric monotonic regression and a polynomial regression. The models are evaluated, a winner is picked, and the predicted values are stored in your data table.

Usage

```
AutoNLS(data, y, x, monotonic = TRUE)
```

Arguments

data	Data is the data table you are building the modeling on
y	Y is the target variable name in quotes
x	X is the independent variable name in quotes
monotonic	This is a TRUE/FALSE indicator - choose TRUE if you want monotonic regression over polynomial regression

Value

A list containing "PredictionData" which is a data table with your original column replaced by the nls model predictions; "ModelName" the model name; "ModelObject" The winning model to later use; "EvaluationMetrics" Model metrics for models with ability to build.

Author(s)

Adrian Antico

Examples

```
## Not run:
# Create Growth Data
data <- data.table::data.table(Target = seq(1, 500, 1),
  Variable = rep(1, 500))
for (i in as.integer(1:500)) {
  if (i == 1) {
    var <- data[i, "Target"][[1]]
    data.table::set(data, i = i, j = 2L,
      value = var * (1 + runif(1) / 100))
  } else {
    var <- data[i - 1, "Variable"][[1]]
    data.table::set(data, i = i, j = 2L,
      value = var * (1 + runif(1) / 100))
  }
}

# Add jitter to Target
data[, Target := jitter(Target, factor = 0.25)]
```

```

# To keep original values
data1 <- data.table::copy(data)

# Merge and Model data
data11 <- AutoNLS(

```

AutoRecomDataCreate	<i>Convert transactional data.table to a binary ratings matrix</i>
---------------------	--

Description

Convert transactional data.table to a binary ratings matrix

Usage

```

AutoRecomDataCreate(
  data,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  MetricColName = "TotalSales",
  ReturnMatrix = FALSE
)

```

Arguments

<code>data</code>	This is your transactional data.table. Must include an Entity (typically customer), ProductCode (such as SKU), and a sales metric (such as total sales).
<code>EntityColName</code>	This is the column name in quotes that represents the column name for the Entity, such as customer
<code>ProductColName</code>	This is the column name in quotes that represents the column name for the product, such as SKU
<code>MetricColName</code>	This is the column name in quotes that represents the column name for the metric, such as total sales
<code>ReturnMatrix</code>	Set to FALSE to coerce the object (desired route) or TRUE to return a matrix

Value

A BinaryRatingsMatrix

Author(s)

Adrian Antico and Douglas Pestana

Examples

```
## Not run:
RatingsMatrix <- AutoRecomDataCreate(
  data,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  MetricColName = "TotalSales",
  ReturnMatrix = TRUE)

## End(Not run)
```

AutoRecommender	<i>Automatically build the best recommender model among models available.</i>
-----------------	---

Description

This function returns the winning model that you pass onto AutoRecommenderScoring

Usage

```
AutoRecommender(
  data,
  Partition = "Split",
  KFold = 1,
  Ratio = 0.75,
  Given = 1,
```

```

    RatingType = "TopN",
    RatingsKeep = 20,
    SkipModels = "AssociationRules",
    ModelMetric = "TPR"
  )

```

Arguments

data	This is your BinaryRatingsMatrix. See function RecomDataCreate
Partition	Choose from "split", "cross-validation", "bootstrap". See evaluationScheme in recommenderlab for details.
KFolds	Choose 1 for traditional train and test. Choose greater than 1 for the number of cross validations
Ratio	The ratio for train and test. E.g. 0.75 for 75 percent data allocated to training
Given	The number of products you would like to evaluate. Negative values implement all-but schemes.
RatingType	Choose from "TopN", "ratings", "ratingMatrix"
RatingsKeep	The total ratings you wish to return. Default is 20.
SkipModels	AssociationRules runs the slowest and may crash your system. Choose from: "AssociationRules", "ItemBasedCF", "UserBasedCF", "PopularItems", "RandomItems"
ModelMetric	Choose from "Precision", "Recall", "TPR", or "FPR"

Value

The winning model used for scoring in the AutoRecommenderScoring function

Author(s)

Adrian Antico and Douglas Pestana

  ModelMetric = "TPR")

## End(Not run)

```

`AutoRecommenderScoring`*The AutoRecomScoring function scores recommender models from AutoRecommender()*

Description

This function will take your ratings matrix and model and score your data in parallel.

Usage

```
AutoRecommenderScoring(  
  data,  
  WinningModel,  
  EntityColName = "CustomerID",  
  ProductColName = "StockCode",  
  NumItemsReturn = 1  
)
```

Arguments

<code>data</code>	The binary ratings matrix from <code>RecomDataCreate()</code>
<code>WinningModel</code>	The winning model returned from <code>AutoRecommender()</code>
<code>EntityColName</code>	Typically your customer ID
<code>ProductColName</code>	Something like "StockCode"
<code>NumItemsReturn</code>	Number of items to return on scoring

Value

Returns the prediction data

Author(s)

Adrian Antico and Douglas Pestana

## End(Not run)

```

AutoTBATS

AutoTBATS

Description

AutoTBATS is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The parameter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```

AutoTBATS(
  data,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxMovingAverages = 5L,
  MaxSeasonalPeriods = 1L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L
)

```

Arguments

data	Source data.table
TargetVariableName	Name of your time series target variable
DateColumnName	Name of your date column
TimeAggLevel	Choose from "year", "quarter", "month", "week", "day", "hour"
EvaluationMetric	Choose from MAE, MSE, and MAPE
NumHoldOutPeriods	Number of time periods to use in the out of sample testing
NumFCPeriods	Number of periods to forecast
MaxLags	A single value of the max number of lags to use in the internal auto.arima of tbats
MaxMovingAverages	A single value of the max number of moving averages to use in the internal auto.arima of tbats
MaxSeasonalPeriods	A single value for the max allowable seasonal periods to be tested in the tbats framework
TrainWeighting	Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.
MaxConsecutiveFails	When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attempts without a new winner before terminating the procedure.
MaxNumberModels	Indicate the maximum number of models to test.
MaxRunTimeMinutes	Indicate the maximum number of minutes to wait for a result.

AutoTransformationCreate

AutoTransformationCreate is a function for automatically identifying the optimal transformations for numeric features and transforming them once identified.

Description

AutoTransformationCreate is a function for automatically identifying the optimal transformations for numeric features and transforming them once identified. This function will loop through your selected transformation options (YeoJohnson, BoxCox, Asinh, Asin, and Logit) and find the one that produces data that is the closest to normally distributed data. It then makes the transformation and collects the metadata information for use in the AutoTransformationScore() function, either by returning the objects (always) or saving them to file (optional).

Usage

```
AutoTransformationCreate(
  data,
  ColumnNames = NULL,
  Methods = c("BoxCox", "YeoJohnson", "Asinh", "Log", "LogPlus1", "Asin", "Logit",
    "Identity"),
  Path = NULL,
  TransID = "ModelID",
  SaveOutput = FALSE
)
```

Arguments

data	This is your source data
ColumnNames	List your columns names in a vector, for example, c("Target", "IV1")
Methods	Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Asin", "Logit", and "Identity".
Path	Set to the directly where you want to save all of your modeling files
TransID	Set to a character value that corresponds with your modeling project
SaveOutput	Set to TRUE to save necessary file to run AutoTransformationScore()

Value

data with transformed columns and the transformation object for back-transforming later

Author(s)

Adrian Antico

Examples

```
## Not run:
Correl <- 0.85
N <- 1000
data <- data.table::data.table(Adrian = runif(N))
```

```

data[, x1 := qnorm(Adrian)]
data[, x2 := runif(N)]
data[, Adrian1 := log(pnorm(Correl * x1 + sqrt(1-Correl^2) * qnorm(x2)))]
data <- RemixAutoML::AutoTransformationCreate(
  data,
  ColumnNames = "Sample",
  Methods = c("BoxCox",
              "YeoJohnson",
              "Asinh",
              "Log",
              "LogPlus1",
              "Asin",
              "Logit",
              "Identity"),
  Path = NULL,
  TransID = "Trans",
  SaveOutput = FALSE)

## End(Not run)

```

AutoTransformationScore

AutoTransformationScore() is a the complimentary function to AutoTransformationCreate()

Description

AutoTransformationScore() is a the compliment function to AutoTransformationCreate(). Automatically apply or inverse the transformations you identified in AutoTransformationCreate() to other data sets. This is useful for applying transformations to your validation and test data sets for modeling. It's also useful for back-transforming your target and prediction columns after you have build and score your models so you can obtain statistics on the original features.

Usage

```

AutoTransformationScore(
  ScoringData,
  FinalResults,
  Type = "Inverse",
  TransID = "TestModel",
  Path = NULL
)

```

Arguments

ScoringData	This is your source data
FinalResults	This is the FinalResults output object from AutoTransformationCreate().
Type	Set to "Inverse" to back-transfrom or "Apply" for applying the transformation.
TransID	Set to a character value that corresponds with your modeling project
Path	Set to the directly where you want to save all of your modeling files

Value

data with transformed columns

Author(s)

Adrian Antico

data <- RemixAutoML::AutoTransformationScore(
  data,
  FinalResults,
  Path = NULL,
  TransID = "Trans")

## End(Not run)
```

AutoTS

AutoTS is an automated time series modeling function

Description

Step 1 is to build all the models and evaluate them on the number of HoldOutPeriods periods you specify. Step 2 is to pick the winner and rebuild the winning model on the full data set. Step 3 is to generate forecasts with the final model for FCPeriods that you specify. AutoTS builds the best time series models for each type, using optimized box-cox transformations and using a user-supplied frequency for the ts data conversion along with a model-based frequency for the ts data conversion, compares all types, selects the winner, and generates a forecast. Models include:

Usage

```
AutoTS(
  data,
  TargetName = "Target",
  DateName = "DateTime",
  FCPeriods = 30,
  HoldOutPeriods = 30,
```

```

EvaluationMetric = "MAPE",
InnerEval = "AICc",
TimeUnit = "day",
Lags = 25,
SLags = 2,
MaxFourierPairs = 0,
NumCores = 4,
SkipModels = NULL,
StepWise = TRUE,
TSClean = TRUE,
ModelFreq = TRUE,
PrintUpdates = FALSE,
PlotPredictionIntervals = TRUE
)

```

Arguments

data	is the source time series data as a <code>data.table</code> - or a data structure that can be converted to a <code>data.table</code>
TargetName	is the name of the target variable in your <code>data.table</code>
DateName	is the name of the date column in your <code>data.table</code>
FCPeriods	is the number of periods into the future you wish to forecast
HoldOutPeriods	is the number of periods to use for validation testing
EvaluationMetric	Set this to either "MAPE", "MSE", or "MAE". Default is "MAPE"
InnerEval	Choose from AICC, AIC, and BIC. These are what the time series models use internally to optimize
TimeUnit	is the level of aggregation your dataset comes in. Choices include: hour, day, week, month, quarter, year, 1Min, 5Min, 10Min, 15Min, and 30Min
Lags	is the number of lags you wish to test in various models (same as moving averages)
SLags	is the number of seasonal lags you wish to test in various models (same as moving averages)
MaxFourierPairs	Set the max number of Fourier terms to test out. They will be utilized in the ARIMA and NN models.
NumCores	is the number of cores available on your computer
SkipModels	Don't run specified models - e.g. exclude all models "DSHW" "ARFIMA" "ARIMA" "ETS" "NNET" "TBATS" "TSLM"
StepWise	Set to TRUE to have ARIMA and ARFIMA run a stepwise selection process. Otherwise, all models will be generated in parallel execution, but still run much slower.
TSClean	Set to TRUE to have missing values interpolated and outliers replaced with interpolated values: creates separate models for a larger comparison set
ModelFreq	Set to TRUE to run a separate version of all models where the time series frequency is chosen algorithmically
PrintUpdates	Set to TRUE for a print to console of function progress
PlotPredictionIntervals	Set to FALSE to not print prediction intervals on your plot output

Details

DSHW: Double Seasonal Holt Winters

ARFIMA: Auto Regressive Fractional Integrated Moving Average

ARIMIA: Stepwise Auto Regressive Integrated Moving Average with specified max lags, seasonal lags, moving averages, and seasonal moving averages

ETS: Additive and Multiplicative Exponential Smoothing and Holt Winters

NNetar: Auto Regressive Neural Network models automatically compares models with 1 lag or 1 seasonal lag compared to models with up to N lags and N seasonal lags

TBATS: Exponential smoothing state space model with Box-Cox transformation, ARMA errors, Trend and Seasonal components

TSLM: Time Series Linear Model - builds a linear model with trend and season components extracted from the data

Value

Returns a list containing 1: A data.table object with a date column and the forecasted values; 2: The model evaluation results; 3: The champion model for later use if desired; 4: The name of the champion model; 5: A time series ggplot with historical values and forecasted values with 80

AutoWord2VecModeler *Automated word2vec data generation via H2O*

Description

This function allows you to automatically build a word2vec model and merge the data onto your supplied dataset

Usage

```

AutoWord2VecModeler(
  data,
  BuildType = "Combined",
  stringCol = c("Text_Col1", "Text_Col2"),
  KeepStringCol = FALSE,
  model_path = NULL,
  vects = 100,
  SaveStopWords = FALSE,
  MinWords = 1,
  WindowSize = 12,
  Epochs = 25,
  StopWords = NULL,
  SaveModel = "standard",
  Threads = max(1, parallel::detectCores() - 2),
  MaxMemory = "28G",
  SaveOutput = FALSE
)

```

Arguments

data	Source data table to merge vects onto
BuildType	Choose from "individual" or "combined". Individual will build a model for every text column. Combined will build a single model for all columns.
stringCol	A string name for the column to convert via word2vec
KeepStringCol	Set to TRUE if you want to keep the original string column that you convert via word2vec
model_path	A string path to the location where you want the model and metadata stored
vects	The number of vectors to retain from the word2vec model

SaveStopWords	Set to TRUE to save the stop words used
MinWords	For H2O word2vec model
WindowSize	For H2O word2vec model
Epochs	For H2O word2vec model
StopWords	For H2O word2vec model
SaveModel	Set to "standard" to save normally; set to "mojo" to save as mojo. NOTE: while you can save a mojo, I haven't figured out how to score it in the AutoH2OScoring function.
Threads	Number of available threads you want to dedicate to model building
MaxMemory	Amount of memory you want to dedicate to model building
SaveOutput	Set to TRUE to save your models to file

## Not run:
data <- AutoWord2VecModeler(
  data,
  BuildType = "individual",
  stringCol = c("Text_Col1", "Text_Col2"),
  KeepStringCol = FALSE,
  model_path = normalizePath("./"),
  vects = 100,
  SaveStopWords = FALSE,
  MinWords = 1,
  WindowSize = 1,
  Epochs = 25,
  StopWords = NULL,
  SaveModel = "standard",
  Threads = max(1, parallel::detectCores()-2),
  MaxMemory = "28G",
  SaveOutput = TRUE)

## End(Not run)
```

Description

This function builds a word frequency table and a word cloud. It prepares data, cleans text, and generates output.

Usage

```
AutoWordFreq(
  data,
  TextColName = "DESCR",
  GroupColName = "ClusterAllNoTarget",
  GroupLevel = 0,
  RemoveEnglishStopwords = TRUE,
  Stemming = TRUE,
  StopWords = c("bla", "bla2")
)
```

Arguments

<code>data</code>	Source data table
<code>TextColName</code>	A string name for the column
<code>GroupColName</code>	Set to NULL to ignore, otherwise set to Cluster column name (or factor column name)
<code>GroupLevel</code>	Must be set if <code>GroupColName</code> is defined. Set to cluster ID (or factor level)
<code>RemoveEnglishStopwords</code>	Set to TRUE to remove English stop words, FALSE to ignore
<code>Stemming</code>	Set to TRUE to run stemming on your text data
<code>StopWords</code>	Add your own stopwords, in vector format

AutoXGBoostCARMA *AutoXGBoostCARMA Automated XGBoost Calendar, Holiday, ARMA, and Trend Variables Forecasting*

Description

AutoXGBoostCARMA Automated XGBoost Calendar, Holiday, ARMA, and Trend Variables Forecasting. Create hundreds of thousands of time series forecasts using this function.

Usage

```
AutoXGBoostCARMA(  
  data,  
  NonNegativePred = FALSE,  
  TrainOnFull = FALSE,  
  TargetColumnName = NULL,  
  DateColumnName = NULL,  
  HierarchGroups = NULL,  
  GroupVariables = NULL,  
  FC_Periods = 5,  
  TimeUnit = "week",  
  TimeGroups = c("weeks", "months"),  
  TargetTransformation = FALSE,  
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),  
  AnomalyDetection = NULL,  
  XREGS = NULL,  
  Lags = c(1:5),  
  MA_Periods = c(1:5),  
  SD_Periods = NULL,  
  Skew_Periods = NULL,  
  Kurt_Periods = NULL,
```

```

Quantile_Periods = NULL,
Quantiles_Selected = NULL,
Difference = TRUE,
FourierTerms = 6,
CalendarVariables = c("second", "minute", "hour", "wday", "mday", "yday", "week",
  "isoweek", "month", "quarter", "year"),
HolidayVariable = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
  "OtherEcclesticalFeasts"),
HolidayLags = 1L,
HolidayMovingAverages = 3L,
TimeTrendVariable = FALSE,
DataTruncate = FALSE,
ZeroPadSeries = NULL,
SplitRatios = c(1 - 10/100, 10/100),
TreeMethod = "hist",
NThreads = max(1, parallel::detectCores() - 2L),
EvalMetric = "MAE",
GridTune = FALSE,
GridEvalMetric = "mae",
ModelCount = 1L,
NTrees = 1000L,
PartitionType = "timeseries",
Timer = TRUE,
DebugMode = FALSE
)

```

Arguments

<code>data</code>	Supply your full series data set here
<code>NonNegativePred</code>	TRUE or FALSE
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>TargetColumnName</code>	List the column name of your target variables column. E.g. "Target"
<code>DateColumnName</code>	List the column name of your date column. E.g. "DateTime"
<code>HierarchGroups</code>	= NULL Character vector or NULL with names of the columns that form the interaction hierarchy
<code>GroupVariables</code>	Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.
<code>FC_Periods</code>	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
<code>TimeUnit</code>	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year"
<code>TimeGroups</code>	Select time aggregations for adding various time aggregated GDL features.
<code>TargetTransformation</code>	Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
<code>Methods</code>	Transformation options to test which include "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"

AnomalyDetection

NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)

XREGS

Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

Lags

Select the periods for all lag variables you want to create. E.g. c(1:5,52)

MA_Periods

Select the periods for all moving average variables you want to create. E.g. c(1:5,52)

SD_Periods

Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)

Skew_Periods

Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)

Kurt_Periods

Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)

Quantile_Periods

Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)

Quantiles_Selected

Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95", "q99")

Difference

Set to TRUE to put the I in ARIMA

FourierTerms

Set to the max number of pairs

CalendarVariables

NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

HolidayVariable

NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

HolidayLags

Number of lags for the holiday counts

HolidayMovingAverages

Number of moving averages for holiday counts

TimeTrendVariable

Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

DataTruncate

Set to TRUE to remove records with missing values from the lags and moving average features created

ZeroPadSeries

Set to "all", "inner", or NULL. See TimeSeriesFill for explanation

SplitRatios

E.g c(0.7,0.2,0.1) for train, validation, and test sets

TreeMethod

Choose from "hist", "gpu_hist"

NThreads

Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8

EvalMetric

Select from "r2", "RMSE", "MSE", "MAE"

GridTune

Set to TRUE to run a grid tune

GridEvalMetric

This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'

ModelCount	Set the number of models to try in the grid tune
NTrees	Select the number of trees you want to have built to train the model
PartitionType	Select "random" for random data partitioning "time" for partitioning by time frames
Timer	Setting to TRUE prints out the forecast number while it is building
DebugMode	Setting to TRUE generates printout of all header code comments during run time of function

Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoXGBoostClassifier *AutoXGBoostClassifier is an automated XGBoost modeling framework with grid-tuning and model evaluation*

Description

AutoXGBoostClassifier is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to

create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoXGBoostClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnFactorLevels = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  Verbose = 0L,
  NumOfParDepPlots = 3L,
  NThreads = 8L,
  eval_metric = "auc",
  TreeMethod = "hist",
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  PassInGrid = NULL,
  Shuffles = 1L,
  Trees = 50L,
  eta = seq(0.05, 0.4, 0.05),
  max_depth = seq(4L, 16L, 2L),
  min_child_weight = seq(1, 10, 1),
  subsample = seq(0.55, 1, 0.05),
  colsample_bytree = seq(0.55, 1, 0.05)
)
```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.
<code>TestData</code>	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 1 numeric variable.
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnFactorLevels	TRUE or FALSE. Set to FALSE to not return factor levels.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
Verbose	Set to 0 if you want to suppress model evaluation updates in training
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
NThreads	Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8
eval_metric	This is the metric used to identify best grid tuned model. Choose from "logloss", "error", "aucpr", "auc"
TreeMethod	Choose from "hist", "gpu_hist"
GridTune	Set to TRUE to run a grid tuning procedure
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MaxModelsInGrid	Number of models to test from grid options.
MaxRunsWithoutNewWinner	A number
MaxRunMinutes	In minutes
PassInGrid	Default is NULL. Provide a data.table of grid options from a previous run.
Shuffles	Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning
Trees	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)
eta	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

max_depth	Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
min_child_weight	Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
subsample	Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)
colsample_bytree	Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoXGBoostHurdleModel

AutoXGBoostHurdleModel is generalized hurdle modeling framework

Description

AutoXGBoostHurdleModel is generalized hurdle modeling framework

Usage

```

AutoXGBoostHurdleModel(
  TreeMethod = "hist",
  TrainOnFull = FALSE,
  PassInGrid = NULL,
  NThreads = max(1L, parallel::detectCores() - 2L),
  ModelID = "ModelTest",

```

```

Paths = NULL,
MetaDataPaths = NULL,
data,
ValidationData = NULL,
TestData = NULL,
Buckets = 0L,
TargetColumnName = NULL,
FeatureColNames = NULL,
IDcols = NULL,
TransformNumericColumns = NULL,
SplitRatios = c(0.7, 0.2, 0.1),
SaveModelObjects = FALSE,
ReturnModelObjects = TRUE,
NumOfParDepPlots = 10L,
GridTune = FALSE,
grid_eval_metric = "accuracy",
MaxModelsInGrid = 1L,
BaselineComparison = "default",
MaxRunsWithoutNewWinner = 10L,
MaxRunMinutes = 60L,
Trees = 1000L,
eta = seq(0.05, 0.4, 0.05),
max_depth = seq(4L, 16L, 2L),
min_child_weight = seq(1, 10, 1),
subsample = seq(0.55, 1, 0.05),
colsample_bytree = seq(0.55, 1, 0.05)
)

```

Arguments

TreeMethod	Set to hist or gpu_hist depending on if you have an xgboost installation capable of gpu processing
TrainOnFull	Set to TRUE to train model on 100 percent of data
PassInGrid	Pass in a grid for changing up the parameter settings for catboost
NThreads	Set to the number of threads you would like to dedicate to training
ModelID	Define a character name for your models
Paths	The path to your folder where you want your model information saved
MetaDataPaths	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.
data	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
ValidationData	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
TestData	Source test data. Do not include a column that has the class labels for the buckets as they are created internally.
Buckets	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
TargetColumnName	Supply the column name or number for the target variable

FeatureColNames	Supply the column names or number of the features (not included the Primary-DateColumn)
IDcols	Includes PrimaryDateColumn and any other columns you want returned in the validation data with predictions
TransformNumericColumns	Transform numeric column inside the AutoCatBoostRegression() function
SplitRatios	Supply vector of partition ratios. For example, c(0.70,0.20,0,10).
SaveModelObjects	Set to TRUE to save the model objects to file in the folders listed in Paths
ReturnModelObjects	Set to TRUE to return all model objects
NumOfParDepPlots	Set to pull back N number of partial dependence calibration plots.
GridTune	Set to TRUE if you want to grid tune the models
grid_eval_metric	Select the metric to optimize in grid tuning. "accuracy", "microauc", "logloss"
MaxModelsInGrid	Set to a numeric value for the number of models to try in grid tune
BaselineComparison	"default"
MaxRunsWithoutNewWinner	Number of runs without a new winner before stopping the grid tuning
MaxRunMinutes	Max number of minutes to allow the grid tuning to run for
Trees	Default 1000
eta	Learning rates seq(0.05,0.40,0.05)
max_depth	Depth seq(4L, 16L, 2L)
min_child_weight	seq(1.0, 10.0, 1.0)
subsample	seq(0.55, 1.0, 0.05)
colsample_bytree	seq(0.55, 1.0, 0.05)

Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, Validation-Data.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoXGBoostMultiClass *AutoXGBoostMultiClass is an automated XGBoost modeling framework with grid-tuning and model evaluation*

Description

AutoXGBoostMultiClass is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, variable importance, and column names used in model fitting.

Usage

```
AutoXGBoostMultiClass(
    data,
    TrainOnFull = FALSE,
    ValidationData = NULL,
    TestData = NULL,
    TargetColumnName = NULL,
    FeatureColNames = NULL,
    IDcols = NULL,
    model_path = NULL,
    metadata_path = NULL,
    ModelID = "FirstModel",
    Objective = "multi:softmax",
    ReturnFactorLevels = TRUE,
    ReturnModelObjects = TRUE,
    SaveModelObjects = FALSE,
    Verbose = 0L,
    NumOfParDepPlots = 3L,
    NThreads = 8L,
    eval_metric = "merror",
    grid_eval_metric = "accuracy",
    TreeMethod = "hist",
    GridTune = FALSE,
    BaselineComparison = "default",
    MaxModelsInGrid = 10L,
    MaxRunsWithoutNewWinner = 20L,
    MaxRunMinutes = 24L * 60L,
    PassInGrid = NULL,
    Shuffles = 1L,
    Trees = 50L,
    eta = NULL,
    max_depth = NULL,
    min_child_weight = NULL,
    subsample = NULL,
    colsample_bytree = NULL
)
```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.

TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 1 numeric variable.
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
Objective	'multi:softmax'
ReturnFactorLevels	TRUE or FALSE. Set to FALSE to not return factor levels.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
Verbose	Set to 0 if you want to suppress model evaluation updates in training
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
NThreads	Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8
eval_metric	This is the metric used to identify best grid tuned model. Choose from "logloss", "error", "aucpr", "auc"
grid_eval_metric	"accuracy", "logloss", "microauc"
TreeMethod	Choose from "hist", "gpu_hist"
GridTune	Set to TRUE to run a grid tuning procedure
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MaxModelsInGrid	Number of models to test from grid options.
MaxRunsWithoutNewWinner	A number
MaxRunMinutes	In minutes
PassInGrid	Default is NULL. Provide a data.table of grid options from a previous run.
Shuffles	Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning

Trees	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)
eta	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)
max_depth	Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
min_child_weight	Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
subsample	Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)
colsample_bytree	Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, GridList, and TargetLevels

AutoXGBoostRegression *AutoXGBoostRegression is an automated XGBoost modeling framework with grid-tuning and model evaluation*

Description

AutoXGBoostRegression is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over

N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoXGBoostRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnFactorLevels = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  Verbose = 0L,
  NumOfParDepPlots = 3L,
  NThreads = 8L,
  eval_metric = "rmse",
  TreeMethod = "hist",
  GridTune = FALSE,
  grid_eval_metric = "rmse",
  BaselineComparison = "default",
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  PassInGrid = NULL,
  Shuffles = 1L,
  Trees = 50L,
  eta = NULL,
  max_depth = NULL,
  min_child_weight = NULL,
  subsample = NULL,
  colsample_bytree = NULL
)
```

Arguments

<code>data</code>	This is your data set for training and testing your model
<code>TrainOnFull</code>	Set to TRUE to train on full data
<code>ValidationData</code>	This is your holdout data set used in modeling either refine your hyperparameters.

TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
ReturnFactorLevels	Set to TRUE to have the factor levels returned with the other model objects
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
TransformNumericColumns	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
Methods	Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.
Verbose	Set to 0 if you want to suppress model evaluation updates in training
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
NThreads	Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8
eval_metric	This is the metric used to identify best grid tuned model. Choose from "r2", "RMSE", "MSE", "MAE"
TreeMethod	Choose from "hist", "gpu_hist"
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
grid_eval_metric	Choose from "poisson", "mae", "mape", "mse", "msle", "kl", "cs", "r2"
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MaxModelsInGrid	Number of models to test from grid options (243 total possible options)
MaxRunsWithoutNewWinner	A number

MaxRunMinutes	In minutes
PassInGrid	Default is NULL. Provide a data.table of grid options from a previous run.
Shuffles	Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning
Trees	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)
eta	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)
max_depth	Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
min_child_weight	Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
subsample	Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)
colsample_bytree	Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and GridList

AutoXGBoostScoring

AutoXGBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions.

Description

AutoXGBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions. This function requires you to supply features for scoring. It will run `ModelDataPrep()` and the `DummifyDT()` function to prepare your features for xgboost data conversion and scoring.

Usage

```

AutoXGBoostScoring(
  TargetType = NULL,
  ScoringData = NULL,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  FactorLevelsList = NULL,
  TargetLevels = NULL,
  Objective = "multi:softmax",
  OneHot = FALSE,
  ModelObject = NULL,
  ModelPath = NULL,
  ModelID = NULL,

```

```

ReturnFeatures = TRUE,
TransformNumeric = FALSE,
BackTransNumeric = FALSE,
TargetColumnName = NULL,
TransformationObject = NULL,
TransID = NULL,
TransPath = NULL,
MDP_Impute = TRUE,
MDP_CharToFactor = TRUE,
MDP_RemoveDates = TRUE,
MDP_MissFactor = "0",
MDP_MissNum = -1
)

```

Arguments

TargetType	Set this value to "regression", "classification", or "multiclass" to score models built using AutoCatBoostRegression(), AutoCatBoostClassify() or AutoCatBoostMultiClass().
ScoringData	This is your data.table of features for scoring. Can be a single row or batch.
FeatureColumnNames	Supply either column names or column numbers used in the AutoXGBoost__() function
IDcols	Supply ID column numbers for any metadata you want returned with your predicted values
FactorLevelsList	Supply the factor variables' list from DummifyDT()
TargetLevels	Supply the target levels output from AutoXGBoostMultiClass() or the scoring function will go looking for it in the file path you supply.
Objective	Set to 'multi:softprobs' if you did so in training. Default is softmax
OneHot	Set to TRUE to have one-hot-encoding run. Otherwise, N columns will be made for N levels of a factor variable
ModelObject	Supply a model for scoring, otherwise it will have to search for it in the file path you specify
ModelPath	Supply your path file used in the AutoXGBoost__() function
ModelID	Supply the model ID used in the AutoXGBoost__() function
ReturnFeatures	Set to TRUE to return your features with the predicted values.
TransformNumeric	Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.
BackTransNumeric	Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.
TargetColumnName	Input your target column name used in training if you are utilizing the transformation service
TransformationObject	Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file.

TransID	Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().
TransPath	Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.
MDP_Impute	Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function
MDP_CharToFactor	Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function
MDP_RemoveDates	Set to TRUE if you have date of timestamp columns in your ScoringData
MDP_MissFactor	If you set MDP_Impute to TRUE, supply the character values to replace missing values with
MDP_MissNum	If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with

Value

A data.table of predicted values with the option to return model features as well.

CarmaCatBoostKeepVarsGDL

CarmaCatBoostKeepVarsGDL

Description

CarmaCatBoostKeepVarsGDL is to help manage carma code

Usage

```

CarmaCatBoostKeepVarsGDL(
  data,
  IndepVarPassTRUE = "GroupVar",
  UpdateData,
  CalendarFeatures,
  XREGS,
  Difference,
  HierarchGroups,
  GroupVariables,
  GroupVarVector,
  CalendarVariables,
  HolidayVariable,
  TargetColumnName,
  DateColumnName
)

```

Arguments

data	Supply data
IndepVarPassTRUE	Name of the column used as a single grouping variable.
UpdateData	Supply UpdateData
CalendarFeatures	Supply CalendarFeatures
XREGS	Supply XREGS
Difference	Supply Difference
HierarchGroups	Supply HierarchGroups
GroupVariables	Supply GroupVariables
GroupVarVector	Supply GroupVarVector
CalendarVariables	Supply CalendarVariables
HolidayVariable	Supply HolidayVariable

TargetColumnName
Supply TargetColumnName
DateColumnName Supply DateColumnName

  GroupVariables,  
  GroupVarVector,  
  CalendarVariables = NULL,  
  HolidayVariable = NULL,  
  TargetColumnName,  
  DateColumnName  
)
```

Arguments

data	Supply data
IndepVarPassTRUE	Name of the column used as a single grouping variable.
UpdateData	Supply UpdateData
CalendarFeatures	Supply CalendarFeatures
XREGS	Supply XREGS
Difference	Supply Difference
HierarchGroups	Supply HierarchGroups
GroupVariables	Supply GroupVariables

```
GroupVarVector Supply GroupVarVector
CalendarVariables Supply CalendarVariables
HolidayVariable Supply HolidayVariable
TargetColumnName Supply TargetColumnName
DateColumnName Supply DateColumnName
```

  SD_Periods = 0L,
  Skew_Periods = 0L,
  Kurt_Periods = 0L,
  Quantile_Periods = 0L
)
```

Arguments

TimeUnit	= TimeUnit
TimeGroups	= TimeGroups
HierarchGroups	= HierarchGroups
GroupVariables	= GroupVariables
FC_Periods	= FC_Periods
PartitionType	= PartitionType
TrainOnFull	= TrainOnFull
SplitRatios	= SplitRatios
SD_Periods	= 0L turns it off, otherwise values must be greater than 1 such as c(2L,5L,6L,25L)
Skew_Periods	= 0L turns it off, otherwise values must be greater than 2 such as c(3L,5L,6L,25L)
Kurt_Periods	= 0L turns it off, otherwise values must be greater than 3 such as c(4L,5L,6L,25L)
Quantile_Periods	= 0L turns it off, otherwise values must be greater than 3 such as c(5L,6L,25L)

CatBoostParameterGrids

CatBoostParameterGrids

Description

CatBoostParameterGrids <https://catboost.ai/docs/concepts/r-training-parameters.html>

Usage

```
CatBoostParameterGrids(
  TaskType = "CPU",
  Shuffles = 1L,
  NTrees = seq(1000L, 10000L, 1000L),
  Depth = seq(4L, 16L, 2L),
  LearningRate = c(0.01, 0.02, 0.03, 0.04),
  L2_Leaf_Reg = seq(1, 10, 1),
  RandomStrength = seq(1, 2, 0.1),
  BorderCount = seq(32, 256, 32),
  RSM = c(0.8, 0.85, 0.9, 0.95, 1),
  BootstrapType = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),
  GrowPolicy = c("SymmetricTree", "Depthwise", "Lossguide")
)
```

Arguments

TaskType	"GPU" or "CPU"
Shuffles	The number of shuffles you want to apply to each grid
NTrees	seq(1000L, 10000L, 1000L)
Depth	seq(4L, 16L, 2L)
LearningRate	seq(0.01,.10,0.01)
L2_Leaf_Reg	c(1.0:10.0)
RandomStrength	seq(1, 2, 0.1)
BorderCount	seq(32,256,32)
RSM	CPU ONLY, Random subspace method.c(0.80, 0.85, 0.90, 0.95, 1.0)
BootStrapType	c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")
GrowPolicy	c("SymmetricTree", "Depthwise", "Lossguide")

Value

A list containing data.table's with the parameters shuffled and ready to test in the bandit framework

Author(s)

Adrian Antico

ChartTheme	<i>ChartTheme function is a ggplot theme generator for ggplots</i>
------------	--

Description

This function helps your ggplots look professional with the choice of the two main colors that will dominate the theme

Usage

```
ChartTheme(
  Size = 12,
  AngleX = 35,
  AngleY = 0,
  ChartColor = "lightsteelblue1",
  BorderColor = "darkblue",
  TextColor = "darkblue",
  GridColor = "white",
  BackGroundColor = "gray95",
  LegendPosition = "bottom"
)
```

Arguments

Size	The size of the axis labels and title
AngleX	The angle of the x axis labels
AngleY	The angle of the Y axis labels
ChartColor	"lightsteelblue1",
BorderColor	"darkblue",
TextColor	"darkblue",
GridColor	"white",
BackGroundColor	"gray95",
LegendPosition	Where to place legend

Value

An object to pass along to ggplot objects following the "+" sign

    mean = 50,
    sd = 20),
    filter=rep(1,10),
    circular=TRUE))
data[, temp := seq(1:1000)][, DateTime := DateTime - temp][
  , temp := NULL]
data <- data[order(DateTime)]
p <- ggplot2::ggplot(data, ggplot2::aes(x = DateTime, y = Target)) +
```

```

    ggplot2::geom_line()
  p <- p + ChartTheme(Size = 12)

  ## End(Not run)

```

ClassificationMetrics *ClassificationMetrics*

Description

ClassificationMetrics

Usage

```

ClassificationMetrics(
  TestData,
  Thresholds,
  Target,
  Predict,
  PositiveOutcome,
  NegativeOutcome,
  CostMatrix = c(1, 0, 0, 1)
)

```

Arguments

TestData	Test data from your modeling
Thresholds	Value
Target	Name of your target variable
Predict	Name of your predicted value variable
PositiveOutcome	The value of the positive outcome level
NegativeOutcome	The value of the negative outcome level
CostMatrix	c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost)

)

```

Arguments

<code>data</code>	data object
<code>PartitionRatios</code>	Requires three values for train, validation, and test data sets
<code>BaseFunnelMeasure</code>	E.g. "Leads". This value should be a forward looking variable. Say you want to forecast <code>ConversionMeasure</code> 2 months into the future. You should have two months into the future of values of <code>BaseFunnelMeasure</code>
<code>ConversionMeasure</code>	E.g. "Conversions". Rate is derived as conversions over leads by cohort periods out
<code>ConversionRateMeasure</code>	Conversions over Leads for every cohort
<code>CohortPeriodsVariable</code>	Numeric. Numerical value of the the number of periods since cohort base date.
<code>CalendarDate</code>	The name of your date column that represents the calendar date
<code>CohortDate</code>	The name of your date column that represents the cohort date
<code>TruncateDate</code>	NULL. Supply a date to represent the earliest point in time you want in your data. Filtering takes place before partitioning data so feature engineering can include as many non null values as possible.
<code>TimeUnit</code>	Base time unit of data. "days", "weeks", "months", "quarters", "years"

CalendarTimeGroups	TimeUnit value must be included. If you want to generate lags and moving averages in several time based aggregations, choose from "days", "weeks", "months", "quarters", "years".
CohortTimeGroups	TimeUnit value must be included. If you want to generate lags and moving averages in several time based aggregations, choose from "days", "weeks", "months", "quarters", "years".
TransformTargetVariable	TRUE or FALSE
TransformMethods	Choose from "Identity", "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"
AnomalyDetection	Provide a named list. See examples
Jobs	Default is "eval" and "train"
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
ModelID	A character string to name your model and output
ModelPath	Path to where you want your models saved
MetaDataPath	Path to where you want your metadata saved. If NULL, function will try ModelPath if it is not NULL.
TaskType	"GPU" or "CPU" for catboost training
NumGPUs	Number of GPU's you would like to utilize
DT_Threads	Number of threads to use for data.table. Default is Total - 2
EvaluationMetric	This is the metric used inside catboost to measure performance on validation data during a grid-tune. "RMSE" is the default, but other options include: "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError".
LossFunction	Used in model training for model fitting. Select from 'RMSE', 'MAE', 'Quantile', 'LogLinQuantile', 'MAPE', 'Poisson', 'PairLogitPairwise', 'Tweedie', 'QueryRMSE'
NumOfParDepPlots	Number of partial dependence plots to return
MetricPeriods	Number of trees to build before the internal catboost eval step happens
CalendarVariables	"wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"
HolidayGroups	c("USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts")
ImputeRollStats	Constant value to fill NA after running AutoLagRollStats()
CohortHolidayLags	c(1L, 2L, 7L),
CohortHolidayMovingAverages	c(3L, 7L),
CalendarHolidayLags	c(1L, 2L, 7L),
CalendarHolidayMovingAverages	= c(3L, 7L),

CalendarLags	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CalendarMovingAverages	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CalendarStandardDeviations	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CalendarSkews	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CalendarKurts	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CalendarQuantiles	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CalendarQuantilesSelected	Supply a vector of "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"
CohortLags	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CohortMovingAverages	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CohortStandardDeviations	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CohortSkews	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CohortKurts	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CohortQuantiles	List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>
CohortQuantilesSelected	Supply a vector of "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"
PassInGrid	Defaults to NULL. Pass in a single row of grid from a previous output as a <code>data.table</code> (they are collected as <code>data.tables</code>)
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in <code>MaxModelsInGrid</code> to tell the procedure how many models you want to test.
BaselineComparison	Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.
MaxModelsInGrid	Number of models to test from grid options
MaxRunMinutes	Maximum number of minutes to let this run
MaxRunsWithoutNewWinner	Number of models built before calling it quits

Trees	Bandit grid partitioned. The maximum number of trees you want in your models
Depth	Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
LearningRate	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)
L2_Leaf_Reg	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
RSM	CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)
BootStrapType	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")
GrowPolicy	Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")

Value

Saves metadata and models to files of your choice. Also returns metadata and models from the function. User specifies both options.

ContinuousTimeDataGenerator

ContinuousTimeDataGenerator for creating continuous time data sets for on demand modeling

Description

ContinuousTimeDataGenerator for creating continuous time data sets for on demand modeling of transactional panel data.

Usage

```
ContinuousTimeDataGenerator(
  data,
  RestrictDateRange = TRUE,
  Case = 2L,
  FC_Periods = 52L,
  SaveData = FALSE,
  FilePath = NULL,
  TargetVariableName = "qty",
  DateVariableName = "date",
  GDL_Targets = NULL,
  TimeUnit = "raw",
  TimeGroups = c("raw", "day", "week"),
  GroupingVariables = "sku",
  HierarchyGroupVars = NULL,
  MinTimeWindow = 1L,
  MinTxnRecords = 2L,
  Lags = 1L:7L,
  MA_Periods = 10L,
  SD_Periods = 10L,
  Skew_Periods = 10L,
  Kurt_Periods = 10L,
  Quantile_Periods = 10L,
  Quantiles_Selected = c("q5"),
  HolidayLags = c(1L:7L),
  HolidayMovingAverages = c(2L:14L),
  TimeBetween = NULL,
  TimeTrendVariable = TRUE,
  CalendarVariables = c("wday", "mday", "yday", "week", "isoweek", "month", "quarter",
    "year"),
  HolidayGroups = "USPublicHolidays",
  PowerRate = 0.5,
  SampleRate = 5,
  TargetWindowSamples = 5,
  PrintSteps = TRUE
)
```

Arguments

data	This is your transactional level data
------	---------------------------------------

RestrictDateRange	Set to TRUE to only pull samples by entity within the entity life (not beyond)
Case	Currently set as 1 for forecasting and 2 for other
FC_Periods	The number of future periods to collect data on
SaveData	Set to TRUE to save the MetaData and final modeling data sets to file
FilePath	Set to your file of choice for where you want the data sets saved
TargetVariableName	The name of your target variable that represents demand
DateVariableName	The date variable of the demand instances
GDL_Targets	The variable names to run through AutoLagRollStats()
TimeUnit	List the time unit your data is aggregated by. E.g. "day", "week", "month", "quarter", "year"
TimeGroups	= c("raw", "day", "week"),
GroupingVariables	These variables (or single variable) is the combination of categorical variables that uniquely defines the level of granularity of each individual level to forecast. E.g. "sku" or c("Store", "Department"). Sku is typically unique for all sku's. Store and Department in combination defines all unique departments as the department may be repeated across the stores.
HierarchyGroupVars	Group vars
MinTimeWindow	The number of time periods you would like to omit for training. Default is 1 so that at a minimum, there is at least one period of values to forecast. You can set it up to a larger value if you do not want more possible target windows for the lower target window values.
MinTxnRecords	I typically set this to 2 so that there is at least one other instance of demand so that the forecasted values are not complete nonsense.
Lags	Select the periods for all lag variables you want to create. E.g. c(1:5,52)
MA_Periods	Select the periods for all moving average variables you want to create. E.g. c(1:5,52)
SD_Periods	Select the periods for all sd variables you want to create. E.g. c(1:5,52)
Skew_Periods	Select the periods for all skew variables you want to create. E.g. c(1:5,52)
Kurt_Periods	Select the periods for all kurtosis variables you want to create. E.g. c(1:5,52)
Quantile_Periods	Select the periods for all quantiles variables you want to create. E.g. c(1:5,52)
Quantiles_Selected	Select the quantiles you want. q5, q10, ..., q95
HolidayLags	Select the lags you want generated
HolidayMovingAverages	Select the moving averages you want generated
TimeBetween	Supply a name or NULL
TimeTrendVariable	Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

CalendarVariables

Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year

HolidayGroups Input the holiday groups of your choice from the CreateHolidayVariable() function in this package

PowerRate Sampling parameter

SampleRate Set this to a value greater than 0. The calculation used is the number of records per group level raised to the power of PowerRate. Then that values is multiplied by SampleRate.

TargetWindowSamples
= 5

PrintSteps Set to TRUE to have operation steps printed to the console

Value

Returns two data.table data sets: The first is a modeling data set for the count distribution while the second data set if for the size model data set.

CreateCalendarVariables

CreateCalendarVariables Create Calendar Variables

Description

CreateCalendarVariables Rapidly creates calendar variables based on the date column you provide

Usage

```

CreateCalendarVariables(
  data,
  DateCols = NULL,
  AsFactor = FALSE,
  TimeUnits = "wday"
)

```

Arguments

data	This is your data
DateCols	Supply either column names or column numbers of your date columns you want to use for creating calendar variables
AsFactor	Set to TRUE if you want factor type columns returned; otherwise integer type columns will be returned
TimeUnits	Supply a character vector of time units for creating calendar variables. Options include: "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

Value

Returns your data.table with the added calendar variables at the end

        "isoweek",
        "month",
        "quarter",
        "year"))))

head(data)
print(runtime)

## End(Not run)
```

CreateHolidayVariables

CreateHolidayVariables Create Holiday Count Columns

Description

CreateHolidayVariables Rapidly creates holiday count variables based on the date columns you provide

Usage

```
CreateHolidayVariables(
  data,
  DateCols = NULL,
  HolidayGroups = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
    "OtherEcclesticalFeasts"),
  Holidays = NULL,
  GroupingVars = NULL,
  Print = FALSE
)
```

Arguments

data	This is your data
DateCols	Supply either column names or column numbers of your date columns you want to use for creating calendar variables
HolidayGroups	Pick groups
Holidays	Pick holidays
GroupingVars	Grouping variable names
Print	Set to TRUE to print iteration number to console

Value

Returns your data.table with the added holiday indicator variable

CreateProjectFolders *CreateProjectFolders Converts path files to proper path files*

Description

CreateProjectFolders Converts path files to proper path files

Usage

```
CreateProjectFolders(
  ProjectName = input$ID_NewProjectName,
  RootPath = input$ID_Root_Folder,
  ExistsButNoProjectList = FALSE,
  Local = FALSE
)
```

Arguments

ProjectName	This is the name of a project which will be the name of the file created in the root folder
RootPath	This is the path file to the root folder
ExistsButNoProjectList	Set to TRUE if the folder exists but not the ProjectList file
Local	a

Value

Returns a proper path file string

DifferenceData	<i>DifferenceData</i>
----------------	-----------------------

Description

DifferenceData differences your data set

Usage

```
DifferenceData(  
  data,  
  ColumnsToDiff = c(names(data)[2:ncol(data)]),  
  CARMA = FALSE,  
  TargetVariable = NULL,  
  GroupingVariable = NULL  
)
```

Arguments

- data Source data
- ColumnsToDiff The column numbers you want differenced
- CARMA Set to TRUE for CARMA functions
- TargetVariable The target variable name
- GroupingVariable Difference data by group

Author(s)

Adrian Antico

DifferenceDataReverse	<i>DifferenceDataReverse</i>
-----------------------	------------------------------

Description

DifferenceDataReverse reverses the difference

Usage

```

DifferenceDataReverse(
  data,
  ScoreData = Forecasts$Predictions,
  LastRow = DiffTrainOutput$LastRow$Weekly_Sales,
  CARMA = FALSE,
  TargetCol = TargetColumnName,
  FirstRow = DiffTrainOutput$FirstRow,
  GroupingVariables = NULL
)

```

Arguments

data	Pre differenced scoring data
ScoreData	Predicted values from ML model
LastRow	The last row from training data target variables
CARMA	Set to TRUE for CARMA utilization
TargetCol	Target column name
FirstRow	The first row of the target variable
GroupingVariables	Group columns

DownloadCSVFromStorageExplorer

DownloadCSVFromStorageExplorer

Description

DownloadCSVFromStorageExplorer

Usage

```

DownloadCSVFromStorageExplorer(
  UploadCSVObjectName = "data.csv",
  SaveCSVFilePath = file.path(Root),
  SaveCSVName = "RawData.csv",
  UploadLocation = "Analytics Sandbox/Machine Learning",
  DataStoreName = NULL
)

```

Arguments

UploadCSVObjectName	Name of the file you uploaded to the Microsoft Azure Storage Explorer
SaveCSVFilePath	Path file to where you want to save your csv in Azure
SaveCSVName	The name you want to give the csv that will be saved
UploadLocation	The location to where the data is saved in the Azure Storage Explorer
DataStoreName	The name of the store in data factory where you uploaded your data

DT_BinaryConfusionMatrix
DT_BinaryConfusionMatrix

Description

DT_BinaryConfusionMatrix is for computing all metrics related to binary modeling outcomes

Usage

```
DT_BinaryConfusionMatrix(
  data = MetricsData,
  GroupVariables = "IntervalNum",
  Target = "ActiveAtInterval",
  Predicted = "p1"
)
```

Arguments

data	Supply your model validation data with predictions
GroupVariables	Supply grouping variables to generate statistics by groups
Target	The name of your target variable column
Predicted	The name of your predicted value column#'

Author(s)

Adrian Antico

See Also

Other Model Evaluation: [ClassificationMetrics\(\)](#), [RemixClassificationMetrics\(\)](#)

Examples

```
## Not run:
AggMetricsByGroup <- DT_BinaryConfusionMatrix(
  data,
  GroupVariables = c("Store","Dept"),
  Target = "HitTarget",
  Predicted = "p1")

## End(Not run)
```

DT_GDL_Feature_Engineering

*An Automated Feature Engineering Function Using data.table frol-
lmean*

Description

Builds autoregressive and moving average from target columns and distributed lags and distributed moving average for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and moving averages. This function works for data with groups and without groups.

Usage

```
DT_GDL_Feature_Engineering(
  data,
  lags = c(seq(1, 50, 1)),
  periods = c(seq(5, 95, 5)),
  SDperiods = c(seq(5, 95, 5)),
  Skewperiods = c(seq(5, 95, 5)),
  Kurtperiods = c(seq(5, 95, 5)),
  Quantileperiods = c(seq(5, 95, 5)),
  statsFUNs = c("mean"),
  targets = NULL,
  groupingVars = NULL,
  sortDateName = NULL,
  timeDiffTarget = NULL,
  timeAgg = c("days"),
  WindowingLag = 0,
  Type = c("Lag"),
  SimpleImpute = TRUE
)
```

Arguments

data	A data.table you want to run the function on
lags	A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.
periods	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.

SDperiods	A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.
Skewperiods	A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.
Kurtperiods	A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.
Quantileperiods	A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.
statsFUNs	Select from the following <code>c("mean", "sd", "skew", "kurt", "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95", "q99")</code>
targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
groupingVars	A character vector of categorical variable names you will build your lags and rolling stats by
sortDateName	The column name of your date column used to sort events over time
timeDiffTarget	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.
timeAgg	List the time aggregation level for the time between events features, such as "hour", "day", "week", "month", "quarter", or "year"
WindowingLag	Set to 0 to build rolling stats off of target columns directly or set to 1 to build the rolling stats off of the lag-1 target
Type	List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1

Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

DummifyDT

DummifyDT creates dummy variables for the selected columns.

Description

DummifyDT creates dummy variables for the selected columns. Either one-hot encoding, N+1 columns for N levels, or N columns for N levels.

Usage

```

DummifyDT(
  data,
  cols,
  KeepFactorCols = FALSE,
  OneHot = FALSE,
  SaveFactorLevels = FALSE,
  SavePath = NULL,
  ImportFactorLevels = FALSE,
  FactorLevelsList = NULL,
  ClustScore = FALSE,
  ReturnFactorLevels = FALSE
)

```

Arguments

<code>data</code>	The data set to run the micro auc on
<code>cols</code>	A vector with the names of the columns you wish to dichotomize
<code>KeepFactorCols</code>	Set to TRUE to keep the original columns used in the dichotomization process

OneHot	Set to TRUE to run one hot encoding, FALSE to generate N columns for N levels
SaveFactorLevels	Set to TRUE to save unique levels of each factor column to file as a csv
SavePath	Provide a file path to save your factor levels. Use this for models that you have to create dummy variables for.
ImportFactorLevels	Instead of using the data you provide, import the factor levels csv to ensure you build out all of the columns you trained with in modeling.
FactorLevelsList	Supply a list of factor variable levels
ClustScore	This is for scoring AutoKMeans. Set to FALSE for all other applications.
ReturnFactorLevels	If you want a named list of all the factor levels returned, set this to TRUE. Doing so will cause the function to return a list with the source data.table and the list of factor variables' levels

Value

Either a data table with new dummy variables columns and optionally removes base columns (if ReturnFactorLevels is FALSE), otherwise a list with the data.table and a list of the factor levels.

EvalPlot

EvalPlot automatically builds calibration plots for model evaluation

Description

This function automatically builds calibration plots and calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```

EvalPlot(
  data,
  PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"),
  GraphType = c("calibration"),
  PercentileBucket = 0.05,
  aggrfun = function(x) mean(x, na.rm = TRUE)
)

```

Arguments

<code>data</code>	Data containing predicted values and actual values for comparison
<code>PredictionColName</code>	String representation of column name with predicted values from model
<code>TargetColName</code>	String representation of column name with target values from model
<code>GraphType</code>	Calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation
<code>PercentileBucket</code>	Number of buckets to partition the space on (0,1) for evaluation
<code>aggrfun</code>	The statistics function used in aggregation, listed as a function

Value

Calibration plot or boxplot

FakeDataGenerator

FakeDataGenerator

Description

FakeDataGenerator

Usage

```
FakeDataGenerator(
  Correlation = 0.7,
  N = 1000L,
  ID = 5L,
  FactorCount = 2L,
  AddDate = TRUE,
  ZIP = 5L,
  TimeSeries = FALSE,
  TimeSeriesTimeAgg = "day",
  ChainLadderData = FALSE,
  Classification = FALSE,
  MultiClass = FALSE
)
```

Arguments

Correlation	Set the correlation value for simulated data
N	Number of records
ID	Number of IDcols to include
FactorCount	Number of factor type columns to create
AddDate	Set to TRUE to include a date column
ZIP	Zero Inflation Model target variable creation. Select from 0 to 5 to create that number of distinctly distributed data, stratified from small to large
TimeSeries	For testing AutoBanditSarima
TimeSeriesTimeAgg	Choose from "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year",
ChainLadderData	Set to TRUE to return Chain Ladder Data for using AutoMLChainLadderTrainer
Classification	Set to TRUE to build classification data
MultiClass	Set to TRUE to build MultiClass data

GenTSAnomVars

GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure

Description

GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure. Data is z-scaled and grouped by factors and time periods to determine which points are above and below the control limits in a cumulative time fashion. Then a cumulative rate is created as the final variable. Set KeepAllCols to FALSE to utilize the intermediate features to create rolling stats from them. The anomalies are separated into those that are extreme on the positive end versus those that are on the negative end.

Usage

```
GenTSAnomVars(
  data,
  ValueCol = "Value",
  GroupVars = NULL,
  DateVar = "DATE",
  HighThreshold = 1.96,
  LowThreshold = -1.96,
  KeepAllCols = TRUE,
  IsDataScaled = FALSE
)
```

Arguments

data	the source residuals data.table
ValueCol	the numeric column to run anomaly detection over
GroupVars	this is a group by variable
DateVar	this is a time variable for grouping
HighThreshold	this is the threshold on the high end
LowThreshold	this is the threshold on the low end
KeepAllCols	set to TRUE to remove the intermediate features
IsDataScaled	set to TRUE if you already scaled your data

Value

The original data.table with the added columns merged in. When KeepAllCols is set to FALSE, you will get back two columns: AnomHighRate and AnomLowRate - these are the cumulative anomaly rates over time for when you get anomalies from above the thresholds (e.g. 1.96) and below the thresholds.

  data,
  ValidationData = NULL,
  Features = NULL,
  RemoveFeatures = FALSE,
  NThreads = max(1L, parallel::detectCores() - 2L),
```

```

MaxMem = "28G",
H2oShutdown = TRUE,
ModelID = "TestModel",
LayerStructure = NULL,
ReturnLayer = 4L,
per_feature = TRUE,
Activation = "Tanh",
Epochs = 5L,
L2 = 0.1,
ElasticAveraging = TRUE,
ElasticAveragingMovingRate = 0.9,
ElasticAveragingRegularization = 0.001
)

```

Arguments

AnomalyDetection	Set to TRUE to run anomaly detection
DimensionReduction	Set to TRUE to run dimension reduction
data	The data.table with the columns you wish to have analyzed
ValidationData	The data.table with the columns you wish to have scored
Features	NULL Column numbers or column names
RemoveFeatures	Set to TRUE if you want the features you specify in the Features argument to be removed from the data returned
NThreads	max(1L, parallel::detectCores()-2L)
MaxMem	"28G"
H2oShutdown	Setting to TRUE will shutdown H2O when it done being used internally.
ModelID	"TestModel"
LayerStructure	a
ReturnLayer	Which layer of the NNet to return. Choose from 1-7 with 4 being the layer with the least amount of nodes
per_feature	Set to TRUE to have per feature anomaly detection generated. Otherwise and overall value will be generated
Activation	Choose from "Tanh", "TanhWithDropout", "Rectifier", "RectifierWithDropout", "Maxout", "MaxoutWithDropout"
Epochs	Quantile value to find the cutoff value for classifying outliers
L2	Specify the amount of memory to allocate to H2O. E.g. "28G"
ElasticAveraging	Specify the number of threads (E.g. cores * 2)
ElasticAveragingMovingRate	Specify the number of decision trees to build
ElasticAveragingRegularization	Specify the row sample rate per tree

Value

A data.table

H2oIsolationForest	<i>H2oIsolationForest for anomaly detection</i>
--------------------	---

Description

H2oIsolationForest for anomaly detection

Usage

```

H2oIsolationForest(
  data,
  TestData = NULL,
  ColumnNumbers = NULL,
  Threshold = 0.975,
  MaxMem = "28G",
  NThreads = -1,
  NTrees = 100,
  SampleRate = (sqrt(5) - 1)/2
)

```

Arguments

data	The data.table with the columns you wish to have analyzed
TestData	Data for scoring the trained isolation forest
ColumnNumbers	A vector with the column numbers you wish to analyze

Threshold	Quantile value to find the cutoff value for classifying outliers
MaxMem	Specify the amount of memory to allocate to H2O. E.g. "28G"
NThreads	Specify the number of threads (E.g. cores * 2)
NTrees	Specify the number of decision trees to build
SampleRate	Specify the row sample rate per tree

Value

A data.table

ID_BuildTrainDataSets *ID_BuildTrainDataSets for assembling data*

Description

ID_BuildTrainDataSets for assembling data for the IntermittentDemandBootStrapper() function.

Usage

```
ID_BuildTrainDataSets(
  MetaData,
  data,
  Case = 2L,
  TargetVariableName = NULL,
  DateVariableName = NULL,
  GroupingVariables = NULL,
  FC_Periods,
  TimeUnit = "week",
  PowerRate = 0.5,
  SampleRate = 5L,
  TargetWindowSamples = 5L
)
```

Arguments

MetaData	This is the metadata returned from the ID_MetadataGenerator() function
data	This is your transactional data
Case	Indicate which data constructor method to use
TargetVariableName	Your target variable names
DateVariableName	Your date variable names
GroupingVariables	Your grouping variables
FC_Periods	The number of periods to forecast
TimeUnit	The time period unit, such as "day", "week", or "month"

PowerRate	The calculated for determining the total samples is number of records to the power of PowerRate. Then that values is multiplied by the SampleRate. This ensures that a more representative sample is generated across the data set.
SampleRate	The value used to sample from each level of the grouping variables
TargetWindowSamples	The number of different targets to utilize for a single random start date

Value

Returns the count modeling data and the size modeling data

ID_MetadataGenerator *ID_MetadataGenerator for summary metadata for transactional data*

Description

ID_MetadataGenerator for summary metadata for transactional data. The data returned from this function feeds into the IntermittentDemandBootStrapper() function.

Usage

```
ID_MetadataGenerator(
  data,
  RestrictDateRange = TRUE,
  DateVariableName = NULL,
  GroupingVariables = NULL,
  MinTimeWindow = 1L,
  MinTxnRecords = 2L,
  DateInterval = "day"
)
```

Arguments

data	This is your transactional level data
RestrictDateRange	
	= TRUE
DateVariableName	
	Bla
GroupingVariables	
	Bla
MinTimeWindow	The number of time periods you would like to omit for training. Default is 1 so that at a minimum, there is at least one period of values to forecast. You can set it up to a larger value if you do not want more possible target windows for the lower target window values.
MinTxnRecords	I typically set this to 2 so that there is at least one other instance of demand so that the forecasted values are not complete nonsense.
DateInterval	This is the time unit for determining date calculations

Value

Returns a data.table with summary information for the IntermittentDemandBootStrapper() function.

  MinTimeWindow = MinTimeWindow,
  MinTxnRecords = MinTxnRecords,
  DateInterval = TimeUnit,
  TimeUnit = TimeUnit
)

## End(Not run)
```

ID_TrainingDataGenerator

ID_TrainingDataGenerator for subsetting data

Description

ID_TrainingDataGenerator for subsetting data for the IntermittentDemandBootStrapper() function.

Usage

```
ID_TrainingDataGenerator(
  data,
  Type = "timetoevent1",
  TargetVariableName = NULL,
  Level = NULL,
  DateVariableName = NULL,
  GroupingVariables = NULL,
  RandomStartDate = NULL,
  TimeUnit = NULL,
  TargetWindow = NULL
)
```

Arguments

data	Source data
Type	"timetoevent1", "eventinwindow1"

TargetVariableName	Name of the variables to run feature engineering on. List the actual target variable name first.
Level	The individual level of your group variable
DateVariableName	Name of your date variable
GroupingVariables	Your grouping variables
RandomStartDate	The date to partition the data
TimeUnit	This is the TimeUnit you selected for aggregation
TargetWindow	The length of the target window sampled

Value

Returns two data sets for the IntermittentDemandBootStrapper() function based on a single level from the grouping variables.

See Also

Other Feature Engineering Helper: [AutoFourierFeatures\(\)](#), [ID_BuildTrainDataSets\(\)](#), [ID_MetadataGenerator\(\)](#)

ID_TrainingDataGenerator2

ID_TrainingDataGenerator2 for subsetting data

Description

ID_TrainingDataGenerator2 for subsetting data for the IntermittentDemandBootStrapper() function.

Usage

```
ID_TrainingDataGenerator2(
  data,
  TargetVariableName = NULL,
  Level = NULL,
  GroupingVariables = NULL,
  DateVariableName = NULL,
  RandomStartDate = NULL,
  TimeUnit = NULL,
  TargetWindow = NULL
)
```

Arguments

data	Source data
TargetVariableName	vector of variable names
Level	The individual level of your group variable
GroupingVariables	Your grouping variables
DateVariableName	Name of your date variable
RandomStartDate	The date to partition the data
TimeUnit	This is the TimeUnit you selected for aggregation
TargetWindow	The length of the target window sampled

Value

Returns two data sets for the IntermittentDemandBootStrapper() function based on a single level from the grouping variables.

IntermittentDemandScoringDataGenerator

IntermittentDemandScoringDataGenerator

Description

IntermittentDemandScoringDataGenerator creates the scoring data for forecasting. It will recreate the same features used for modeling, take the most recent record, and then duplicate those records for each forecast period specified.

Usage

```
IntermittentDemandScoringDataGenerator(
  data = NULL,
  FC_Periods = 52,
  SaveData = FALSE,
  FilePath = NULL,
  TargetVariableName = "qty",
  DateVariableName = "date",
  GroupingVariables = "sku",
  Lags = 1:7,
  MovingAverages = seq(7, 28, 7),
  TimeTrendVariable = TRUE,
  TimeUnit = "day",
  CurrentDate = NULL,
```

```

    CalendarVariables = c("wday", "mday", "yday", "week", "isoweek", "month", "quarter",
                          "year"),
    HolidayGroups = "USPublicHolidays"
)

```

Arguments

<code>data</code>	This is your source data
<code>FC_Periods</code>	The number of periods you set up to forecast
<code>SaveData</code>	Set to TRUE to save the output data to file
<code>FilePath</code>	Set a path file have the data saved there
<code>TargetVariableName</code>	Name or column number of your target variable
<code>DateVariableName</code>	Name or column number of your date variable
<code>GroupingVariables</code>	Name or column number of your group variables
<code>Lags</code>	The number of lags used in building the modeling data sets
<code>MovingAverages</code>	The number of moving averages used in building the modeling data sets
<code>TimeTrendVariable</code>	Set to TRUE if you did so in model data creation
<code>TimeUnit</code>	Set to the same time unit used in modeling data creation
<code>CurrentDate</code>	Set this to the current date or a date that you want. It is user specified in case you want to score historical data.
<code>CalendarVariables</code>	Set this to the same setting you used in modeling data creation
<code>HolidayGroups</code>	Set this to the same setting you used in modeling data creation

Value

Returns the most recent records for every level of your grouping variables with all the feature used in model building

Author(s)

Adrian Antico

    HolidayGroups = "USPublicHolidays")

## End(Not run)

```

LimeModel

LimeModel to build a lime model

Description

LimeModel to build a lime model for prediction explanations in this package#'

Usage

```

LimeModel(
  data,
  Model = NULL,
  Bins = 10,
  ModelType = "xgboost",
  NThreads = parallel::detectCores(),
  MaxMem = "32G",
  ModelPath = NULL,
  ModelID = NULL
)

```

Arguments

data	Supply a training data set. This data set should be the data right before it gets converted to an h2o, catboost, or xgboost data object.
Model	Supply the model returned from training with the Auto__() functions.
Bins	Number of bins for discretizing numeric features
ModelType	Select from xgboost, h2o, and catboost
NThreads	Number of CPU threads
MaxMem	For use with H2O models. E.g. set to "28G"
ModelPath	Set to the path where your ML model is saved
ModelID	ID used to identify your ML model

Value

Model for utilizing lime

Author(s)

Adrian Antico

ModelDataPrep	<i>Final Data Preparation Function</i>
---------------	--

Description

This function replaces inf values with NA, converts characters to factors, and imputes with constants

Usage

```
ModelDataPrep(
  data,
  Impute = TRUE,
  CharToFactor = TRUE,
  FactorToChar = FALSE,
  IntToNumeric = TRUE,
  DateToChar = FALSE,
  RemoveDates = FALSE,
  MissFactor = "0",
  MissNum = -1,
  IgnoreCols = NULL
)
```

Arguments

data	This is your source data you'd like to modify
Impute	Defaults to TRUE which tells the function to impute the data
CharToFactor	Defaults to TRUE which tells the function to convert characters to factors
FactorToChar	Converts to character
IntToNumeric	Defaults to TRUE which tells the function to convert integers to numeric
DateToChar	Converts date columns into character columns
RemoveDates	Defaults to FALSE. Set to TRUE to remove date columns from your data.table
MissFactor	Supply the value to impute missing factor levels
MissNum	Supply the value to impute missing numeric values
IgnoreCols	Supply column numbers for columns you want the function to ignore

Value

Returns the original data table with corrected values

Author(s)

Adrian Antico

OptimizeArfima

OptimizeArfima is a function that takes raw data and returns time series data

Description

OptimizeArfima is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

Usage

```

OptimizeArfima(
  Output,
  MetricSelection = "MAE",
  DataSetName = NULL,
  train = NULL,
  test = NULL,
  Lags = NULL,
  MovingAverages = NULL,
  FullData = NULL,
  HoldOutPeriods = NULL,
  MinVal = NULL,
  TargetName = NULL,
  DateName = NULL,
  TrainValidateShare = NULL,
  FinalGrid = NULL
)

```

Arguments

Output	This is passed through as output from TimeSeriesDataPrepare() and passed through ParallelArima()
MetricSelection	Select from "MSE", "MAE", or "MAPE"
DataSetName	This is the name of the data set passed through in parallel loop
train	Training data returned from TimeSeriesDataPrepare()
test	Test data returned from TimeSeriesDataPrepare()
Lags	Max lags
MovingAverages	Max moving averages

FullData	Full series data for scoring and ensemble
HoldOutPeriods	Holdout periods returned from TimeSeriesDataPrepare()
MinVal	Minimum value of target variable returned from TimeSeriesDataPrepare()
TargetName	Target variable name returned from TimeSeriesDataPrepare()
DateName	Date variable name returned from TimeSeriesDataPrepare()
TrainValidateShare	A two-element numeric vector. The first element is the weight applied to the training performance and the remainder is applied to the validation performance.
FinalGrid	Grid for forecasting models

Value

Time series data sets to pass onto auto modeling functions

Author(s)

Adrian Antico

OptimizeArima	<i>OptimizeArima is a function that takes raw data and returns time series data</i>
---------------	---

Description

OptimizeArima is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

Usage

```
OptimizeArima(  
  Output,  
  MetricSelection = "MAE",  
  DataSetName = NULL,  
  train = NULL,  
  test = NULL,  
  FullData = NULL,  
  HoldOutPeriods = NULL,  
  MinVal = NULL,  
  TargetName = NULL,  
  DateName = NULL,  
  Lags = NULL,  
  SeasonalLags = NULL,  
  MovingAverages = NULL,  
  SeasonalMovingAverages = NULL,  
  Differences = NULL,  
  SeasonalDifferences = NULL,  
  MaxFourierTerms = NULL,  
  TrainValidateShare = NULL,  
  MaxRunsWithoutNewWinner = 20,  
  MaxNumberModels = NULL,  
  MaxRunMinutes = NULL,  
  FinalGrid = NULL,  
  DebugMode = FALSE  
)
```

Arguments

Output	This is passed through as output from TimeSeriesDataPrepare() and passed through ParallelArima()
MetricSelection	Select from "MSE", "MAE", or "MAPE"
DataSetName	This is the name of the data set passed through in parallel loop
train	Training data returned from TimeSeriesDataPrepare()
test	Test data returned from TimeSeriesDataPrepare()
FullData	Full series data for scoring and ensemble
HoldOutPeriods	Holdout periods returned from TimeSeriesDataPrepare()

MinVal	Minimum value of target variable returned from TimeSeriesDataPrepare()
TargetName	Target variable name returned from TimeSeriesDataPrepare()
DateName	Date variable name returned from TimeSeriesDataPrepare()
Lags	Max value of lag returned from TimeSeriesDataPrepare()
SeasonalLags	Max value of seasonal lags returned from TimeSeriesDataPrepare()
MovingAverages	Max value of moving averages
SeasonalMovingAverages	Max value of seasonal moving average
Differences	Max value of difference returned from TimeSeriesDataPrepare()
SeasonalDifferences	Max value of seasonal difference returned from TimeSeriesDataPrepare()
MaxFourierTerms	Max value of fourier pairs
TrainValidateShare	A two-element numeric vector. The first element is the weight applied to the training performance and the remainder is applied to the validation performance.
MaxRunsWithoutNewWinner	The number of runs without a new winner which if passed tells the function to stop
MaxNumberModels	The number of models you want to test.
MaxRunMinutes	Time
FinalGrid	If NULL, regular train optimization occurs. If the grid is supplied, final builds are conducted.
DebugMode	Debugging

Value

Time series data sets to pass onto auto modeling functions

OptimizeETS

OptimizeETS is a function that takes raw data and returns time series data

Description

OptimizeETS is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

Usage

```

OptimizeETS(
  Output,
  MetricSelection = "MAE",
  DataSetName = NULL,
  train = NULL,
  test = NULL,
  FullData = NULL,
  HoldOutPeriods = NULL,
  MinVal = NULL,
  TargetName = NULL,
  DateName = NULL,
  TrainValidateShare = NULL,
  FinalGrid = NULL
)

```

Arguments

Output	This is passed through as output from TimeSeriesDataPrepare() and passed through ParallelArima()
--------	--

MetricSelection	Select from "MSE", "MAE", or "MAPE"
DataSetName	This is the name of the data set passed through in parallel loop
train	Training data returned from TimeSeriesDataPrepare()
test	Test data returned from TimeSeriesDataPrepare()
FullData	Full series data for scoring and ensemble
HoldOutPeriods	Holdout periods returned from TimeSeriesDataPrepare()
MinVal	Minimum value of target variable returned from TimeSeriesDataPrepare()
TargetName	Target variable name returned from TimeSeriesDataPrepare()
DateName	Date variable name returned from TimeSeriesDataPrepare()
TrainValidateShare	A two-element numeric vector. The first element is the weight applied to the training performance and the remainder is applied to the validation performance.

OptimizeNNET

OptimizeNNET is a function that takes raw data and returns time series data

Description

OptimizeNNET is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

Usage

```
OptimizeNNET(
  Output,
  MetricSelection = "MAE",
  DataSetName = NULL,
  train = NULL,
  test = NULL,
  FullData = NULL,
  HoldOutPeriods = NULL,
  MinVal = NULL,
  TargetName = NULL,
  DateName = NULL,
  Lags = NULL,
  SeasonalLags = NULL,
  MaxFourierTerms = NULL,
  TrainValidateShare = NULL,
  MaxRunsWithoutNewWinner = 20,
  MaxNumberModels = NULL,
  MaxRunMinutes = NULL,
  FinalGrid = NULL
)
```

Arguments

Output	This is passed through as output from TimeSeriesDataPrepare() and passed through ParallelArima()
MetricSelection	Select from "MSE", "MAE", or "MAPE"
DataSetName	This is the name of the data set passed through in parallel loop
train	Training data returned from TimeSeriesDataPrepare()
test	Test data returned from TimeSeriesDataPrepare()
FullData	Full series data for scoring and ensemble
HoldOutPeriods	Holdout periods returned from TimeSeriesDataPrepare()
MinVal	Minimum value of target variable returned from TimeSeriesDataPrepare()
TargetName	Target variable name returned from TimeSeriesDataPrepare()
DateName	Date variable name returned from TimeSeriesDataPrepare()
Lags	Max value of lag returned from TimeSeriesDataPrepare()

SeasonalLags	Max value of seasonal lags returned from TimeSeriesDataPrepare()
MaxFourierTerms	Max value of fourier pairs
TrainValidateShare	A two-element numeric vector. The first element is the weight applied to the training performance and the remainder is applied to the validation performance.
MaxRunsWithoutNewWinner	The number of runs without a new winner which if passed tells the function to stop

ParDepCalPlots	<i>ParDepCalPlots automatically builds partial dependence calibration plots for model evaluation</i>
----------------	--

Description

This function automatically builds partial dependence calibration plots and partial dependence calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```
ParDepCalPlots(
  data,
  PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"),
  IndepVar = c("Independent_Variable_Name"),
```

```

    GraphType = c("calibration"),
    PercentileBucket = 0.05,
    FactLevels = 10,
    Function = function(x) mean(x, na.rm = TRUE)
  )

```

Arguments

<code>data</code>	Data containing predicted values and actual values for comparison
<code>PredictionColName</code>	Predicted values column names
<code>TargetColName</code>	Target value column names
<code>IndepVar</code>	Independent variable column names
<code>GraphType</code>	calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation
<code>PercentileBucket</code>	Number of buckets to partition the space on (0,1) for evaluation
<code>FactLevels</code>	The number of levels to show on the chart (1. Levels are chosen based on frequency; 2. all other levels grouped and labeled as "Other")
<code>Function</code>	Supply the function you wish to use for aggregation.

Value

Partial dependence calibration plot or boxplot

Partial_DT_GDL_Feature_Engineering

A version of the DT_GDL function for creating the GDL features for a new set of records

Description

For scoring models in production that have > 1 grouping variables and for when you need > 1 record (or records per grouping variables) returned. This function is for generating lags and moving averages (along with lags and moving averages off of time between records), for a partial set of records in your data set, typical new records that become available for model scoring. Column names and ordering will be identical to the output from the corresponding DT_GDL_Feature_Engineering() function, which most likely was used to create features for model training.

Usage

```
Partial_DT_GDL_Feature_Engineering(
  data,
  lags = c(seq(1, 5, 1)),
  periods = c(3, 5, 10, 15, 20, 25),
  SDperiods = c(seq(5, 95, 5)),
  Skewperiods = c(seq(5, 95, 5)),
  Kurtperiods = c(seq(5, 95, 5)),
  Quantileperiods = c(seq(5, 95, 5)),
  statsFUNs = c("mean"),
  targets = c("Target"),
  groupingVars = NULL,
  sortDateName = NULL,
  timeDiffTarget = NULL,
  timeAgg = NULL,
  WindowingLag = 1,
  Type = "Lag",
  Timer = TRUE,
  SimpleImpute = TRUE,
  AscRowByGroup = "temp",
  RecordsKeep = 1,
  AscRowRemove = TRUE
)
```

Arguments

data	A data.table you want to run the function on
lags	A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.
periods	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
SDperiods	A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.
Skewperiods	A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.

Kurtperiods	A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.
Quantileperiods	A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.
statsFUNs	Select from the following c("mean","sd","skew","kurt","q5","q10","q15","q20","q25","q30","q35","q40","q45","q50")
targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
groupingVars	A character vector of categorical variable names you will build your lags and rolling stats by
sortDateName	The column name of your date column used to sort events over time
timeDiffTarget	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.
timeAgg	List the time aggregation level for the time between events features, such as "hour", "day", "week", "month", "quarter", or "year"
WindowingLag	Set to 0 to build rolling stats off of target columns directly or set to 1 to build the rolling stats off of the lag-1 target
Type	List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values
Timer	Set to TRUE if you percentage complete tracker printout
SimpleImpute	Set to TRUE for factor level imputation of "0" and numeric imputation of -1
AscRowByGroup	Required to have a column with a Row Number by group (if grouping) with the smallest numbers being the records for scoring (typically the most current in time).
RecordsKeep	List the row number of AscRowByGroup and those data points will be returned
AscRowRemove	Set to TRUE to remove the AscRowByGroup column upon returning data.

Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

## End(Not run)

```

PredictArima

PredictArima to forecast an Arima() model from the stats package

Description

PredictArima is a function to overwrite the s3 generic `getS3method('predict','Arima')`

Usage

```

PredictArima(
  object = Results,
  n.ahead = FCPeriods,
  newxreg = NULL,
  se.fit = TRUE
)

```

Arguments

<code>object</code>	Object that stores the output from Arima()
<code>n.ahead</code>	Number of forecast periods to forecast
<code>newxreg</code>	NULL by default. Forward looking independent variables as matrix type
<code>se.fit</code>	Set to FALSE to not return prediction intervals with the forecast

PrintObjectsSize	<i>PrintObjectsSize prints out the top N objects and their associated sizes, sorted by size</i>
------------------	---

Description

PrintObjectsSize prints out the top N objects and their associated sizes, sorted by size

Usage

```
PrintObjectsSize(N = 10)
```

Arguments

N	The number of objects to display
---	----------------------------------

Value

A print to your console of the sizes of the objects in your environment

```

ProblematicFeatures	<i>ProblematicFeatures identifies problematic features for machine learning</i>
---------------------	---

Description

ProblematicFeatures identifies problematic features for machine learning and outputs a data.table of the feature names in the first column and the metrics they failed to pass in the columns.

Usage

```
ProblematicFeatures(
  data,
  ColumnNumbers = c(1:ncol(data)),
  NearZeroVarThresh = 0.05,
  CharUniqThresh = 0.5,
  NA_Rate = 0.2,
  Zero_Rate = 0.2,
  HighSkewThresh = 10
)
```

Arguments

data	The data.table with the columns you wish to have analyzed
ColumnNumbers	A vector with the column numbers you wish to analyze
NearZeroVarThresh	Set to NULL to not run NearZeroVar(). Checks to see if the percentage of values in your numeric columns that are not constant are greater than the value you set here. If not, the feature is collected and returned with the percentage unique value.
CharUniqThresh	Set to NULL to not run CharUniqthresh(). Checks to see if the percentage of unique levels / groups in your categorical feature is greater than the value you supply. If it is, the feature name is returned with the percentage unique value.
NA_Rate	Set to NULL to not run NA_Rate(). Checks to see if the percentage of NA's in your features is greater than the value you supply. If it is, the feature name is returned with the percentage of NA values.
Zero_Rate	Set to NULL to not run Zero_Rate(). Checks to see if the percentage of zero's in your features is greater than the value you supply. If it is, the feature name is returned with the percentage of zero values.
HighSkewThresh	Set to NULL to not run HighSkew(). Checks for numeric columns whose ratio of the sum of the top 5th percentile of values to the bottom 95th percentile of values is greater than the value you supply. If true, the column name and value is returned.

Value

data table with new dummy variables columns and optionally removes base columns

QA_WALMARTDATAGENERATOR

QA_WALMARTDATAGENERATOR

Description

QA_WALMARTDATAGENERATOR

Usage

QA_WALMARTDATAGENERATOR(data, Groups = 1L, TimeUnit__ = "WEEK")

Arguments

data	supply walmart data for either a single group or two group case. For no group, use XX
Groups	Supply either 0L, 1L, or 2L to indicate the number of group variables to have tested
TimeUnit__	= TimeUnit_

Author(s)

Adrian Antico

RedYellowGreen	<i>RedYellowGreen is for determining the optimal thresholds for binary classification when do-nothing is an option</i>
----------------	--

Description

This function will find the optimal thresholds for applying the main label and for finding the optimal range for doing nothing when you can quantify the cost of doing nothing

Usage

```
RedYellowGreen(
  data,
  PredictColNumber = 2,
  ActualColNumber = 1,
  TruePositiveCost = 0,
  TrueNegativeCost = 0,
  FalsePositiveCost = -10,
  FalseNegativeCost = -50,
  MidTierCost = -2,
  Cores = 8,
  Precision = 0.01,
  Boundaries = c(0.05, 0.75)
)
```

Arguments

data	data is the data table with your predicted and actual values from a classification model
PredictColNumber	The column number where the prediction variable is located (in binary form)
ActualColNumber	The column number where the target variable is located
TruePositiveCost	This is the utility for generating a true positive prediction
TrueNegativeCost	This is the utility for generating a true negative prediction
FalsePositiveCost	This is the cost of generating a false positive prediction
FalseNegativeCost	This is the cost of generating a false negative prediction
MidTierCost	This is the cost of doing nothing (or whatever it means to not classify in your case)
Cores	Number of cores on your machine
Precision	Set the decimal number to increment by between 0 and 1
Boundaries	Supply a vector of two values c(lower bound, upper bound) where the first value is the smallest threshold you want to test and the second value is the largest value you want to test. Note, if your results are at the boundaries you supplied, you should extent the boundary that was reached until the values is within both revised boundaries.

Value

A data table with all evaluated strategies, parameters, and utilities, along with a 3d scatterplot of the results

Regular_Performance	<i>Regular_Performance creates and stores model results in Experiment Grid</i>
---------------------	--

Description

Regular_Performance creates and stores model results in Experiment Grid

Usage

```
Regular_Performance(
  Model = NULL,
  Results = Results,
  GridList = GridList,
  TrainValidateShare = c(0.5, 0.5),
  ExperimentGrid = ExperimentGrid,
```

```
run = run,
train = train,
ValidationData = ValidationData,
HoldOutPeriods = HoldOutPeriods
)
```

Arguments

Model	Set to ets, tbats, arfima, tslm, nnetar
Results	This is a time series model
GridList	List
TrainValidateShare	The values used to blend training and validation performance
ExperimentGrid	The results collection table
run	Iterator
train	Data set
ValidationData	Data set
HoldOutPeriods	Passthrough

```

```

H2oAutoMLTestData = NULL,
H2oGBMTestData = NULL,
H2oDRFTestData = NULL,
H2oGLMTestData = NULL,
XGBoostTestData = NULL
)

```

Arguments

MLModels	A vector of model names from remixautoml. e.g. c("catboost","h2oautoml","h2ogbm","h2odrf","h2o",
TargetVariable	Name of your target variable
Thresholds	seq(0.01,0.99,0.01),
CostMatrix	c(1,0,0,1),
ClassLabels	c(1,0),
CatBoostTestData	Test data returned from AutoCatBoostClassifier
H2oAutoMLTestData	Test data returned from AutoCatBoostClassifier
H2oGBMTestData	Test data returned from AutoH2oGBMClassifier
H2oDRFTestData	Test data returned from AutoH2oDRFClassifier

ResidualOutliers

ResidualOutliers is an automated time series outlier detection function

Description

ResidualOutliers is an automated time series outlier detection function that utilizes tsoutliers and auto.arima. It looks for five types of outliers: "AO" Additive outlier - a singular extreme outlier that surrounding values aren't affected by; "IO" Innovational outlier - Initial outlier with subsequent anomalous values; "LS" Level shift - An initial outlier with subsequent observations being shifted by some constant on average; "TC" Transient change - initial outlier with lingering effects that dissipate exponentially over time; "SLS" Seasonal level shift - similar to level shift but on a seasonal scale.

Usage

```
ResidualOutliers(
  data,
  DateColName = "DateTime",
  TargetColName = "Target",
  PredictedColName = NULL,
  TimeUnit = "day",
  Lags = 5,
  MA = 5,
  SLags = 0,
  SMA = 0,
  tstat = 2
)
```

Arguments

data	the source residuals data.table
DateColName	The name of your data column to use in reference to the target variable
TargetColName	The name of your target variable column
PredictedColName	The name of your predicted value column. If you supply this, you will run anomaly detection of the difference between the target variable and your predicted value. If you leave PredictedColName NULL then you will run anomaly detection over the target variable.
TimeUnit	The time unit of your date column: hour, day, week, month, quarter, year
Lags	the largest lag or moving average (seasonal too) values for the arima fit
MA	Max moving average
SLags	Max seasonal lags
SMA	Max seasonal moving averages
tstat	the t-stat value for tsoutliers

Value

A named list containing FullData = original data.table with outliers data and ARIMA_MODEL = the arima model.

  )

```

Arguments

ExperimentGrid	This is a data.table of grid params and model results
ModelType	"classification", "regression", and "multiclass"
ModelRun	Model iteration number
NEWGrid	Previous grid passed in
NewPerformance	Internal
BestPerformance	Internal
TrialVector	Numeric vector with the total trials for each arm
SuccessVector	Numeric vector with the total successes for each arm
GridIDS	The numeric vector that identifies which grid is which
BanditArmsCount	The number of arms in the bandit
RunsWithoutNewWinner	Counter of the number of models previously built without being a new winner
MaxRunsWithoutNewWinner	Maximum number of models built without a new best model (constraint)
MaxNumberModels	Maximum number of models to build (constraint)
MaxRunMinutes	Run time constraint
TotalRunTime	Cumulative run time in minutes
BanditProbabilities	Initial probabilities from RL_Initialize()

)

```

Arguments

Results	This is a time series model
NextGrid	Bandit grid
TrainValidateShare	The values used to blend training and validation performance
MaxFourierTerms	Numeric value
XREGFC	Fourier terms for forecasting
ExperimentGrid	The results collection table

run	Iterator

RL_Update	<i>RL_Update</i>
-----------	------------------

Description

RL_Update updates the bandit probabilities for selecting different grids

Usage

```
RL_Update(
  ExperimentGrid = ExperimentGrid,
  MetricSelection = MetricSelection,
  ModelRun = run,
  NEWGrid = NewGrid,
  TrialVector = Trials,
  SuccessVector = Successes,
  GridIDS = GridIDS,
  BanditArmsCount = BanditArmsN,
  RunsWithoutNewWinner = RunsWithoutNewWinner,
  MaxRunsWithoutNewWinner = MaxRunsWithoutNewWinner,
  MaxNumberModels = MaxNumberModels,
  MaxRunMinutes = MaxRunMinutes,
  TotalRunTime = TotalRunTime,
  BanditProbabilities = BanditProbs
)
```

Arguments

ExperimentGrid	This is a data.table of grid params and model results
MetricSelection	The chosen metric to evaluate models
ModelRun	Model iteration number
NEWGrid	Previous grid passed in
TrialVector	Numeric vector with the total trials for each arm
SuccessVector	Numeric vector with the total successes for each arm
GridIDS	The numeric vector that identifies which grid is which
BanditArmsCount	The number of arms in the bandit
RunsWithoutNewWinner	Counter of the number of models previously built without being a new winner
MaxRunsWithoutNewWinner	Maximum number of models built without a new best model (constraint)
MaxNumberModels	Maximum number of models to build (constraint)
MaxRunMinutes	Run time constraint
TotalRunTime	Cumulative run time in minutes
BanditProbabilities	Initial probabilities from RL_Initialize()

## End(Not run)
```

RPM_Binomial_Bandit	<i>RPM_Binomial_Bandit</i>
---------------------	----------------------------

Description

RPM_Binomial_Bandit computes randomized probability matching probabilities for each arm being best in a multi-armed bandit. Close cousin to Thomson Sampling.

Usage

```
RPM_Binomial_Bandit(  
  Success,  
  Trials,  
  Alpha = 1L,  
  Beta = 1L,  
  SubDivisions = 1000L  
)
```

Arguments

Success	Vector of successes. One slot per arm.
Trials	Vector of trials. One slot per arm.
Alpha	Prior parameter for success
Beta	Prior parameter for trials
SubDivisions	Default is 100L in the stats package. Changed it to 1000 for this function.

Value

Probability of each arm being the best arm compared to all other arms.

SQL_ClearTable

SQL_ClearTable

Description

SQL_ClearTable get data from a database

Usage

```
SQL_ClearTable(
  DBConnection,
  SQLTableName = "",
  CloseChannel = TRUE,
  Errors = TRUE
)
```

Arguments

DBConnection	RemixAutoML::SQL_Server_DBConnection()
SQLTableName	The SQL statement you want to run
CloseChannel	TRUE to close when done, FALSE to leave the channel open
Errors	Set to TRUE to halt, FALSE to return -1 in cases of errors

Usage

```
SQL_SaveTable(
  DataToPush,
  DBConnection,
  SQLTableName = "",
  RowNames = NULL,
  ColNames = TRUE,
  CloseChannel = TRUE,
  AppendData = FALSE,
  AddPK = TRUE,
  Safer = TRUE
)
```

Arguments

DataToPush	data to be sent to warehouse
DBConnection	RemixAutoML::SQL_Server_DBConnection()
SQLTableName	The SQL statement you want to run
RowNames	c("Segment", "Date")
ColNames	Column names in first row
CloseChannel	TRUE to close when done, FALSE to leave the channel open
AppendData	TRUE or FALSE
AddPK	Add a PK column to table
Safer	TRUE

SQL_UpdateTable	<i>SQL_UpdateTable</i>
-----------------	------------------------

Description

SQL_UpdateTable get data from a database

Usage

```
SQL_UpdateTable(
  DataToPush,
  DBConnection,
  SQLTableName = "",
  Index = NULL,
  CloseChannel = TRUE,
  Verbose = TRUE,
  Test = FALSE,
  NAString = "NA",
  Fast = TRUE
)
```

Arguments

DataToPush	Update data table in warehouse with new values
DBConnection	RemixAutoML::SQL_Server_DBConnection()
SQLTableName	The SQL statement you want to run
Index	Column name of index
CloseChannel	TRUE to close when done, FALSE to leave the channel open
Verbose	TRUE or FALSE
Test	Set to TRUE to see if what you plan to do will work
NAString	Supply character string to supply missing values
Fast	Set to TRUE to update table in one shot versus row by row

StackedTimeSeriesEnsembleForecast

TimeSeriesEnsembleForecast

Description

TimeSeriesEnsembleForecast to generate forecasts and ensemble data

Usage

```
StackedTimeSeriesEnsembleForecast(
  TS_Models = c("arima", "tbats", "nnet"),
  ML_Methods = c("CatBoost", "XGBoost", "H2oGBM", "H2oDRF"),
  CalendarFeatures = TRUE,
  HolidayFeatures = TRUE,
  FourierFeatures = NULL,
  Path = "C:/Users/aantico/Documents/Package",
  TargetName = "Weekly_Sales",
  DateName = "Date",
  NTrees = 750,
  TaskType = "GPU",
  GridTune = FALSE,
  FCPeriods = 5,
  MaxNumberModels = 5
)
```

Arguments

TS_Models	Select which ts model forecasts to ensemble
ML_Methods	Select which models to build for the ensemble
CalendarFeatures	TRUE or FALSE
HolidayFeatures	TRUE or FALSE
FourierFeatures	Full set of fourier features for train and score
Path	The path to the folder where the ts forecasts are stored
TargetName	"Weekly_Sales"
DateName	"Date"
NTrees	Select the number of trees to utilize in ML models
TaskType	GPU or CPU
GridTune	Set to TRUE to grid tune the ML models
FCPeriods	Number of periods to forecast
MaxNumberModels	The number of models to try for each ML model

tempDatesFun

tempDatesFun Convert Excel datetime char columns to Date columns

Description

tempDatesFun takes the Excel datetime column, which imports as character, and converts it into a date type

Usage

```
tempDatesFun(x)
```

Arguments

x The column of interest

Value

An object to pass along to ggplot objects following the "+" sign

## End(Not run)
```

threshOptim

Utility maximizing thresholds for binary classification

Description

This function will return the utility maximizing threshold for future predictions along with the data generated to estimate the threshold

Usage

```
threshOptim(
  data,
  actTar = "target",
  predTar = "p1",
  tpProfit = 0,
  tnProfit = 0,
  fpProfit = -1,
  fnProfit = -2,
  MinThresh = 0.001,
  MaxThresh = 0.999,
  ThresholdPrecision = 0.001
)
```

Arguments

data	data is the data table you are building the modeling on
actTar	The column name where the actual target variable is located (in binary form)
predTar	The column name where the predicted values are located
tpProfit	This is the utility for generating a true positive prediction
tnProfit	This is the utility for generating a true negative prediction
fpProfit	This is the cost of generating a false positive prediction
fnProfit	This is the cost of generating a false negative prediction
MinThresh	Minimum value to consider for model threshold
MaxThresh	Maximum value to consider for model threshold
ThresholdPrecision	Incrementing value in search

Value

Optimal threshold and corresponding utilities for the range of thresholds tested

```

TimeSeriesDataPrepare *TimeSeriesDataPrepare is a function that takes raw data and returns time series data*

Description

TimeSeriesDataPrepare is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

Usage

```

TimeSeriesDataPrepare(
  data,
  TargetName,
  DateName,
  Lags,
  SeasonalLags,
  MovingAverages,
  SeasonalMovingAverages,
  TimeUnit,
  FCPeriods,
  HoldOutPeriods,
  TSClean = TRUE,
  ModelFreq = TRUE,
  FinalBuild = FALSE
)

```

Arguments

data	Source data.table for forecasting
TargetName	Name of your target variable
DateName	Name of your date variable
Lags	The max number of lags you want to test
SeasonalLags	The max number of seasonal lags you want to test
MovingAverages	The max number of moving average terms
SeasonalMovingAverages	The max number of seasonal moving average terms

TimeUnit	The level of aggregation your dataset comes in. Choices include: 1Min, 5Min, 10Min, 15Min, and 30Min, hour, day, week, month, quarter, year
FCPeriods	The number of forecast periods you want to have forecasted
HoldOutPeriods	The number of holdout samples to compare models against
TSClean	TRUE or FALSE. TRUE will kick off a time series cleaning operation. Outliers will be smoothed and imputation will be conducted.
ModelFreq	TRUE or FALSE. TRUE will enable a model-based time frequency calculation for an alternative frequency value to test models on.
FinalBuild	Set to TRUE to create data sets with full data

Value

Time series data sets to pass onto auto modeling functions

Author(s)

Adrian Antico

  FinalBuild = FALSE)

## End(Not run)
```

TimeSeriesFill

*TimeSeriesFill For Completing Time Series Data***Description**

TimeSeriesFill For Completing Time Series Data For Single Series or Time Series by Group

Usage

```
TimeSeriesFill(
  data = data,
  DateColumnName = "Date",
  GroupVariables = NULL,
  TimeUnit = "days",
  FillType = "all"
)
```

Arguments

data	Supply your full series data set here
DateColumnName	Supply the name of your date column
GroupVariables	Supply the column names of your group variables. E.g. "Group" or c("Group1", "Group2")
TimeUnit	Choose from "second", "minute", "hour", "day", "week", "month", "quarter", "year"
FillType	Choose from "all" or "inner". Only relevant for when you have GroupVariables. The "all" option will take the max date and the min date of the entire data set and fill according to those. The "inner" option will grab the max and min dates by group levels and fill each group level based on those.

Value

Returns a data table with missing time series records filled (currently just zeros)

  TargetVariable = "TargetVariableName",  
  DateVariable = "DateVariableName",  
  GroupVariables = "GroupVariableName",  
  VLineDate = NULL,  
  Aggregate = NULL,
```

```

    NumberGroupsDisplay = 5,
    LevelsToDisplay = NULL,
    OtherGroupLabel = "Other",
    DisplayOtherGroup = FALSE,
    TextSize = 12,
    LineWidth = 1,
    Color = "blue",
    XTickMarks = "1 year",
    Size = 12,
    AngleX = 35,
    AngleY = 0,
    ChartColor = "lightsteelblue1",
    BorderColor = "darkblue",
    TextColor = "darkblue",
    GridColor = "white",
    BackGroundColor = "gray95",
    LegendPosition = "bottom",
    LegendTextColor = "darkblue",
    LegendTextSize = 10,
    ForecastLineColor = "black",
    Forecast = FALSE,
    PredictionIntervals = FALSE,
    TS_ModelID = NULL,
    PredictionIntervalColorInner = "aquamarine1",
    PredictionIntervalColorOuter = "peachpuff1"
)

```

Arguments

data	Source data
TargetVariable	Target variable
DateVariable	Date variable
GroupVariables	Group variables
VLineDate	Date of last actual target value
Aggregate	Choose from 'sum' or 'mean'
NumberGroupsDisplay	Number of lines to display
LevelsToDisplay	Value
OtherGroupLabel	Label to call all other group levels
DisplayOtherGroup	If TRUE, a line will be shown with all levels that fall into 'other' otherwise no line will be shown
TextSize	Default 12
LineWidth	Numeric value. Default is 1
Color	Set to "blue", "red", etc
XTickMarks	Number of tick marks on x-axis. "1 minute", "15 minutes", "30 minutes", "1 hour", "3 hour", "6 hour", "12 hour", "1 day", "3 day", "1 week", "2 week", "1 month", "3 month", "6 month", "1 year", "2 year", "5 year", "10 year"

Size	Size of text on plot
AngleX	Angle of text on x axis
AngleY	Angle of text on y axis
ChartColor	Color of chart background
BorderColor	Color of border
TextColor	Text color
GridColor	Grid color
BackgroundColor	Background color
LegendPosition	Legend position
LegendTextColor	Text color
LegendTextSize	Text size
ForecastLineColor	Forecast line color
Forecast	Set to TRUE to use forecast plots
PredictionIntervals	Set to TRUE to plot prediction intervals
TS_ModelID	Select a model from the list for forecasting viewer
PredictionIntervalColorInner	Fills 20th to 80th percentiles
PredictionIntervalColorOuter	Fills 5th to 20th and 80th to 95th percentiles

XGBoostClassifierParams
XGBoostClassifierParams

Description

XGBoostClassifierParams

Usage

```
XGBoostClassifierParams(  
  counter = NULL,  
  NThreads = -1L,  
  BanditArmsN = NULL,  
  eval_metric = NULL,  
  task_type = NULL,  
  model_path = NULL,  
  NewGrid = NULL,  
  Grid = NULL,  
  ExperimentalGrid = NULL,  
  GridClusters = NULL  
)
```

Arguments

counter	Passthrough
NThreads	= -1L,
BanditArmsN	Passthrough
eval_metric	Passthrough
task_type	Passthrough
model_path	Passthrough
NewGrid	Passthrough
Grid	Passthrough
ExperimentalGrid	Passthrough
GridClusters	Passthrough

XGBoostMultiClassParams
XGBoostMultiClassParams

Description

XGBoostMultiClassParams

Usage

```
XGBoostMultiClassParams(  
  counter = NULL,  
  num_class = NULL,  
  NThreads = -1L,  
  BanditArmsN = NULL,  
  eval_metric = NULL,  
  task_type = NULL,  
  model_path = NULL,  
  NewGrid = NULL,  
  Grid = NULL,  
  ExperimentalGrid = NULL,  
  GridClusters = NULL  
)
```

Arguments

counter	Passthrough
num_class	NULL
NThreads	= -1L,
BanditArmsN	Passthrough
eval_metric	Passthrough
task_type	Passthrough
model_path	Passthrough
NewGrid	Passthrough
Grid	Passthrough
ExperimentalGrid	Passthrough
GridClusters	Passthrough

XGBoostParameterGrids	<i>XGBoostParameterGrids</i>
-----------------------	------------------------------

Description

XGBoostParameterGrids

Usage

```
XGBoostParameterGrids(  
  TaskType = "CPU",  
  Shuffles = 1L,  
  NTrees = seq(500L, 5000L, 500L),  
  Depth = seq(4L, 16L, 2L),  
  LearningRate = seq(0.05, 0.4, 0.05),  
  MinChildWeight = seq(1, 10, 1),  
  SubSample = seq(0.55, 1, 0.05),  
  ColSampleByTree = seq(0.55, 1, 0.05)  
)
```

Arguments

TaskType	"GPU" or "CPU"
Shuffles	The number of shuffles you want to apply to each grid
NTrees	seq(500L, 5000L, 500L)
Depth	seq(4L, 16L, 2L)
LearningRate	seq(0.05,0.40,0.05)
MinChildWeight	seq(1.0, 10.0, 1.0)
SubSample	seq(0.55, 1.0, 0.05)
ColSampleByTree	seq(0.55, 1.0, 0.05)

Value

A list containing data.table's with the parameters shuffled and ready to test in the bandit framework

XGBoostRegressionMetrics
XGBoostRegressionMetrics

Description

XGBoostRegressionMetrics

Usage

XGBoostRegressionMetrics(grid_eval_metric, MinVal, calibEval)

Arguments

grid_eval_metric	Passthrough
MinVal	= -1L,
calibEval	Passthrough

Author(s)

Adrian Antico
