

# Package ‘RemixAutoML’

October 8, 2020

**Title** Remix Automated Machine Learning

**Version** 0.2.4

**Date** 2020-10-08

**Maintainer** Adrian Antico <adrianantico@gmail.com>

**Description** R package for the automation of machine learning, forecasting, feature engineering, model evaluation, model interpretation, data generation, and recommenders. Build using data.table for all tabular data-related tasks.

**License** MPL-2.0 | file LICENSE

**URL** <https://github.com/AdrianAntico/RemixAutoML>

**BugReports** <https://github.com/AdrianAntico/RemixAutoML/issues>

**Depends** R (>= 3.5.0)

**Imports** arules, bit64, catboost, combinat, data.table, doParallel, e1071, fBasics, foreach, forecast, ggplot2, grid, h2o, itertools, lime, lubridate, methods, MLmetrics, monreg, nortest, parallel, pROC, RColorBrewer, recommenderlab, scatterplot3d, stats, stringr, timeDate, tsoutliers, wordcloud, xgboost

**Suggests** knitr, rmarkdown, sde, testthat, fpp, gridExtra

**VignetteBuilder** knitr

**Additional\_repositories** <https://github.com/catboost/catboost/tree/master/catboost/R-package>

**Contact** Adrian Antico

**Encoding** UTF-8

**Language** en-US

**LazyData** true

**NeedsCompilation** no

**RoxygenNote** 7.1.1

**SystemRequirements** Java (>= 7.0)

**Author** Adrian Antico [aut, cre], Douglas Pestana [ctb]

**ByteCompile** TRUE

**R topics documented:**

| RemixAutoML-package | <i>Automated Machine Learning Remixed</i> |
|---------------------|---|

---

## Description

Automated Machine Learning Remixed for real-world use-cases. The package utilizes data.table under the hood for all data wrangling like operations so it's super fast and memory efficient. All ML methods are available in R or Python. The forecasting functions are unique and state of the art. There are feature engineering functions in this package that you cannot find anywhere else.

## Details

See the github README for details and examples [www.github.com/AdrianAntico/RemixAutoML](http://www.github.com/AdrianAntico/RemixAutoML)

|----------------|-----------------------|
| AutoBanditNNet | <i>AutoBanditNNet</i> |
|----------------|-----------------------|

---

## Description

AutoBanditNNet is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The parameter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

**Usage**

```

AutoBanditNNet(
  data,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxSeasonalLags = 1L,
  MaxFourierPairs = 2L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L
)

```

**Arguments**

|                                  |   |
|----------------------------------|---|
| <code>data</code>                | Source data.table   |
| <code>TargetVariableName</code>  | Name of your time series target variable  |
| <code>DateColumnName</code>      | Name of your date column  |
| <code>TimeAggLevel</code>        | Choose from "year", "quarter", "month", "week", "day", "hour"   |
| <code>EvaluationMetric</code>    | Choose from MAE, MSE, and MAPE  |
| <code>NumHoldOutPeriods</code>   | Number of time periods to use in the out of sample testing  |
| <code>NumFCPeriods</code>        | Number of periods to forecast   |
| <code>MaxLags</code>             | A single value of the max number of lags to test  |
| <code>MaxSeasonalLags</code>     | A single value of the max number of seasonal lags to test   |
| <code>MaxFourierPairs</code>     | A single value of the max number of fourier pairs to test   |
| <code>TrainWeighting</code>      | Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent. |
| <code>MaxConsecutiveFails</code> | When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attempts without a new winner before terminating the procedure.    |
| <code>MaxNumberModels</code>     | Indicate the maximum number of models to test.  |
| <code>MaxRunTimeMinutes</code>   | Indicate the maximum number of minutes to wait for a result.  |

AutoBanditSarima

*AutoBanditSarima*

---

**Description**

AutoBanditSarima is a multi-armed bandit model testing framework for SARIMA. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic auto.arima from the forecast package. Depending on how many lags, moving averages, seasonal lags and moving averages you test the number of combinations of features to test begins to approach 100,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags and moving averages. The parameter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

**Usage**

```
AutoBanditSarima(
  data,
  ByDataType = TRUE,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxSeasonallLags = 0L,
  MaxMovingAverages = 5L,
  MaxSeasonalMovingAverages = 0L,
  MaxFourierPairs = 2L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 25L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, parallel::detectCores()),
  DebugMode = FALSE
)
```

**Arguments**

|  |   |
|--|---|
| <code>data</code>                      | Source data.table   |
| <code>ByDataType</code>                | TRUE returns the best model from the four base sets of possible models. FALSE returns the best model.   |
| <code>TargetVariableName</code>        | Name of your time series target variable  |
| <code>DateColumnName</code>            | Name of your date column  |
| <code>TimeAggLevel</code>              | Choose from "year", "quarter", "month", "week", "day", "hour"   |
| <code>EvaluationMetric</code>          | Choose from MAE, MSE, and MAPE  |
| <code>NumHoldOutPeriods</code>         | Number of time periods to use in the out of sample testing  |
| <code>NumFCPeriods</code>              | Number of periods to forecast   |
| <code>MaxLags</code>                   | A single value of the max number of lags to test  |
| <code>MaxSeasonalLags</code>           | A single value of the max number of seasonal lags to test   |
| <code>MaxMovingAverages</code>         | A single value of the max number of moving averages to test   |
| <code>MaxSeasonalMovingAverages</code> | A single value of the max number of seasonal moving averages to test  |
| <code>MaxFourierPairs</code>           | A single value of the max number of fourier pairs to test   |
| <code>TrainWeighting</code>            | Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent. |
| <code>MaxConsecutiveFails</code>       | When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attempts without a new winner before terminating the procedure.    |
| <code>MaxNumberModels</code>           | Indicate the maximum number of models to test.  |
| <code>MaxRunTimeMinutes</code>         | Indicate the maximum number of minutes to wait for a result.  |
| <code>NumberCores</code>               | Number of cores to use in parallelism. E.g. if you have a 4 core CPU then supply 4 if you want to utilize all four cores  |
| <code>DebugMode</code>                 | Set to TRUE to get print outs of particular steps helpful in tracing errors   |

**Value**

data.table containing historical values and the forecast values along with the grid tuning results in full detail, as a second data.table

DataPath            In quotes, provide the file path to where your data is stored

dataForecastX      = "RawDataXREG.csv" Use quotes. # Be aware that grouped data and using XREGS\_ requires that your joining group variables have the same name. MUST SUPPLY VALUE

dataX               = "RawDataXREG.csv" Use quotes. # Be aware that grouped data and using XREGS\_ requires that your joining group variables have the same name. MUST SUPPLY VALUE

XREGSX             = "XREG.csv" Use quotes. # data.table with ONLY 3 COLUMN TYPES: 1: - GroupVariables\_ and DateColumnName\_ join-by variables with matching join column names and data types compared to data\_ and; 2 - features - needs to exist for all historical periods matching data\_ along with a sufficient amount of data to cover the forecast period as defined by FC\_Periods\_. OR Supply NULL to arg.

TargetColumnName\_       = "Weekly\_Sales" # WalmartData target column name.

DateColumnName\_       = "Date" # Name of data\_ date column name.

HierarchGroups\_       = c("Store","Dept") # NULL otherwise

GroupVariables\_       = c("Store","Dept") #

TimeUnit\_            = "week" # Choices include "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year"

TimeGroups\_          = c("weeks","months","quarter") # These will tell GDL to build gdl features along the time aggregation dimension

ZeroPadSeries\_       = c('NULL', 'all', 'inner') ZeroPadSeries choose "all", "inner", or NULL. 'Outer' grows missing dates by group to the largest of all groups size. 'Inner' fills in series by using the group level's own max and min values (versus filling all group levels to the max value of the groups level with the widest time gap)

DataTruncate\_        = FALSE # TRUE will truncate all rows where GDL columns produced a -1 (remove all rows where ID < max(rolling stats)). FALSE otherwise.

SplitRatios\_         = c(1 - 10 / 143, 10 / 143) # If you have GroupVariables\_ then base it on number of records in a group, like default

PartitionType\_       = "timeseries" # always time series for this function. Place holder for other time series options down the road.

TrainOnFull\_         = FALSE # Set to TRUE put in Forecast mode. FALSE to put in Evaluation mode. Forecast mode generates forecasts based on a model built using all of data\_, and no evaluation metrics are collected when set to TRUE. Evaluation mode will build a forecast for your validation periods and collect the holdout metrics and other evaluation objects, but no future forecast beyond max date of data\_. as specified in SplitRatios\_.

FC\_Periods\_          = 4 # Self explanatory

EvalMetric\_          = "RMSE" # "RMSE" only with catboost 17.5

GridTune\_            = FALSE # NEEDS TO BE UPDATED ONCE BANDIT GRID TUNING WORKS.

GridEvalMetric\_       = "mae" # 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'. If metric computation fails then no output is generated in final metric evaluation data.table

ModelCount\_          = 5 # NEEDS TO BE UPDATED ONCE BANDIT GRID TUNING WORKS.

TaskType\_ = "GPU" # Set to "CPU" to train on CPU versus GPU. Must supply a value.  
 Timer\_ = TRUE # Print out the forecast step the function is currently working on. If it errors on the first run scoring the model then it is likely a very different error then if has printed "Forecasting 1:"  
 TargetTransformation\_ = TRUE # Set to TRUE to have every available numeric transformation compete for best normalization fit to normal distribution  
 Difference\_ = TRUE # The I in ARIMA. Works for single series and grouped series a.k.a. panel data.  
 CalendarVariables\_ = TRUE # This TURNS ON procedure to create numeric calendar variables that your TimeUnit\_ directs. FALSE otherwise.  
 HolidayVariable\_ = TRUE # This TURNS ON procedure to create a numeric holiday count variable. FALSE otherwise.  
 HolidayLags\_ = c(1:2) # Supply a numeric vector of lag periods  
 HolidayMovingAverages\_ = c(1:2) # Supply a numeric vector of Moving Average periods  
 Lags\_ = c(1:5) # Numeric vector of lag periods  
 MA\_Periods\_ = c(1:5) # Numeric vector of lag periods  
 SD\_Periods\_ = c(2:5) # Numeric vector of lag periods  
 Skew\_Periods\_ = c(3:5) # Numeric vector of lag periods  
 Kurt\_Periods\_ = c(4:5) # Numeric vector of lag periods  
 Quantile\_Periods\_ = c(3:5) # Numeric vector of lag periods  
 Quantiles\_Selected\_ = c("q5","q95") # Select the quantiles you want calculated. "q5", "q10", ..., "q95".  
 FourierTerms\_ = 2 # (TECHNICALLY FOURIER PAIRS) Hierarchy grouping (full group variable interaction set) is ran by default (MAKE INTO OPTION). Uses parallelization to loop through the unique set of all GroupVariables levels and computes fourier terms as if the group level's are a single series; just for all groups and it's parallelized.  
 TimeTrendVariable\_ = TRUE # Set to TRUE to have a sequence created from 1 to nrow by group or single series  
 NTrees\_ = 150 # Number of trees to have trained. Can be 10000 or more depending on group level size.  
 DebugMode\_ = TRUE # When TRUE it will print every comment section header line. When it crashes, you can get a print out of the last N steps that were ran, depending on the print max limit.  
 OptionsWarn Set to 1 to print warnings immediately to screen versus after a function finishes; 2 to kill processes if a warning occurs. See options(warn = )

## Description

AutoCatBoostCARMA Multivariate Forecasting with calendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

## Usage

```
AutoCatBoostCARMA(
  data,
  NonNegativePred = FALSE,

)

```

### Arguments

|                      |  |
|----------------------|--|
| data                 | Supply your full series data set here  |
| NonNegativePred      | TRUE or FALSE  |
| TrainOnFull          | Set to TRUE to train on full data  |
| TargetColumnName     | List the column name of your target variables column. E.g. "Target"  |
| DateColumnName       | List the column name of your date column. E.g. "DateTime"  |
| HierarchGroups       | Vector of hierachy categorical columns.  |
| GroupVariables       | Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.   |
| FC_Periods           | Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead   |
| TimeUnit             | List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".  |
| TimeGroups           | Select time aggregations for adding various time aggregated GDL features.  |
| NumOfParDepPlots     | Supply a number for the number of partial dependence plots you want returned   |
| TargetTransformation | Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).                                       |
| Methods              | Transformation options to test which include "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"   |
| AnomalyDetection     | NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)  |
| XREGS                | Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied. |
| Lags                 | Select the periods for all lag variables you want to create. E.g. c(1:5,52)  |
| MA_Periods           | Select the periods for all moving average variables you want to create. E.g. c(1:5,52)   |

|                         |  |
|-------------------------|--|
| SD_Periods              | Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)  |
| Skew_Periods            | Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)  |
| Kurt_Periods            | Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)  |
| Quantile_Periods        | Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)   |
| Quantiles_Selected      | Select from the following "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"   |
| Difference              | Puts the I in ARIMA for single series and grouped series.  |
| FourierTerms            | Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.   |
| CalendarVariables       | NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"   |
| HolidayVariable         | NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"   |
| HolidayLags             | Number of lags to build off of the holiday count variable.   |
| HolidayMovingAverages   | Number of moving averages to build off of the holiday count variable.  |
| TimeTrendVariable       | Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point. |
| ZeroPadSeries           | Set to "all", "inner", or NULL. See TimeSeriesFill for explanation   |
| DataTruncate            | Set to TRUE to remove records with missing values from the lags and moving average features created  |
| SplitRatios             | E.g c(0.7,0.2,0.1) for train, validation, and test sets  |
| TaskType                | Default is "GPU" but you can also set it to "CPU"  |
| NumGPU                  | Defaults to 1. If CPU is set this argument will be ignored.  |
| EvalMetric              | Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"  |
| GridTune                | Set to TRUE to run a grid tune   |
| GridEvalMetric          | This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'  |
| ModelCount              | Set the number of models to try in the grid tune   |
| MaxRunsWithoutNewWinner | Default is 50  |
| MaxRunMinutes           | Default is 60*60   |
| NTrees                  | Select the number of trees you want to have built to train the model   |
| L2_Leaf_Reg             | l2 reg parameter   |

|                |  |
|----------------|--|
| RandomStrength | Default is 1   |
| BorderCount    | Default is 254   |
| Depth          | Depth of catboost model  |
| PartitionType  | Select "random" for random data partitioning "timeseries" for partitioning by time frames      |
| Timer          | Set to FALSE to turn off the updating print statements for progress                            |
| DebugMode      | Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function |

### Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoCatBoostClassifier

*AutoCatBoostClassifier is an automated catboost model grid-tuning classifier and evaluation system*

---

## Description

AutoCatBoostClassifier is an automated modeling function that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train, validation, and test sets (if not supplied). Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions (on test data), an ROC plot, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting. You can download the catboost package using devtools, via: `devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')`

## Usage

```

AutoCatBoostClassifier(
  data,

## Arguments

|                                |  |
|--------------------------------|--|
| <code>data</code>              | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>       | Set to TRUE to train on full data and skip over evaluation steps   |
| <code>ValidationData</code>    | This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TestData</code>          | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TargetColumnName</code>  | Either supply the target column name OR the column number where the target is located, but not mixed types. Note that the target column needs to be a 0   1 numeric variable.  |
| <code>FeatureColNames</code>   | Either supply the feature column names OR the column number where the target is located, but not mixed types. Also, not zero-indexed.  |
| <code>PrimaryDateColumn</code> | Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling  |
| <code>ClassWeights</code>      | Supply a vector of weights for your target classes. E.g. c(0.25, 1) to weight your 0 class by 0.25 and your 1 class by 1.  |
| <code>IDcols</code>            | A vector of column names or column numbers to keep in your data but not include in the modeling.   |
| <code>task_type</code>         | Set to "GPU" to utilize your GPU for training. Default is "CPU".   |
| <code>NumGPUs</code>           | Numeric. If you have 4 GPUs supply 4 as a value.   |
| <code>eval_metric</code>       | This is the metric used inside catboost to measure performance on validation data during a grid-tune. "AUC" is the default. 'Logloss', 'CrossEntropy', 'Precision', 'Recall', 'F1', 'BalancedAccuracy', 'BalancedErrorRate', 'MCC', 'Accuracy', 'CtrFactor', 'AUC', 'BrierScore', 'HingeLoss', 'HammingLoss', 'Ze- |

|                         |   |
|-------------------------|---|
|                         | roOneLoss', 'Kappa', 'WKappa', 'LogLikelihoodOfPrediction', 'TotalF1', 'Pair-Logit', 'PairLogitPairwise', 'PairAccuracy', 'QueryCrossEntropy', 'QuerySoft-Max', 'PFound', 'NDCG', 'AverageGain', 'PrecisionAt', 'RecallAt', 'MAP'                       |
| loss_function           | Default is NULL. Select the loss function of choice. c("MultiRMSE", 'Logloss', 'CrossEntropy', 'Lq',  |
| model_path              | A character string of your path file to where you want your output saved  |
| metadata_path           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.  |
| ModelID                 | A character string to name your model and output  |
| NumOfParDepPlots        | Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)   |
| ReturnModelObjects      | Set to TRUE to output all modeling objects. E.g. plots and evaluation metrics   |
| SaveModelObjects        | Set to TRUE to return all modeling objects to your environment  |
| PassInGrid              | Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)   |
| GridTune                | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.   |
| MaxModelsInGrid         | Number of models to test from grid options.   |
| MaxRunsWithoutNewWinner | A number  |
| MaxRunMinutes           | In minutes  |
| Shuffles                | Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning   |
| BaselineComparison      | Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.   |
| MetricPeriods           | Number of trees to build before evaluating intermediate metrics. Default is 10L   |
| Trees                   | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L) |
| Depth                   | Bandit grid partitioned Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)  |
| LearningRate            | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)       |
| L2_Leaf_Reg             | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)                    |
| RandomStrength          | A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.   |

|               |   |
|---------------|---|
| BorderCount   | Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU   |
| RSM           | CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)                     |
| BootStrapType | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No") |
| GrowPolicy    | Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")                         |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model (the model), ValidationData.csv, ROC\_Plot.png, EvaluationPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoCatBoostFreqSizeScoring

*AutoCatBoostFreqSizeScoring is for scoring the models build with AutoCatBoostSizeFreqDist()*

---

## Description

AutoCatBoostFreqSizeScoring is for scoring the models build with AutoCatBoostSizeFreqDist(). It will return the predicted values for every quantile model for both distributions for 1 to the max forecast periods you provided to build the scoring data.

**Usage**

```
AutoCatBoostFreqSizeScoring(
  ScoringData,
  TargetColumnNames = NULL,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  CountQuantiles = seq(0.1, 0.9, 0.1),
  SizeQuantiles = seq(0.1, 0.9, 0.1),
  ModelPath = NULL,
  ModelIDs = c("CountModel", "SizeModel"),
  KeepFeatures = TRUE
)
```

**Arguments**

|                    |  |
|--------------------|--|
| ScoringData        | The scoring data returned from <code>IntermittentDemandScoringDataGenerator()</code>           |
| TargetColumnNames  | A character or numeric vector of the target names. E.g. <code>c("Counts", "TARGET_qty")</code> |
| FeatureColumnNames | A character vector of column names or column numbers   |
| IDcols             | ID columns you want returned with the data that is not a model feature                         |
| CountQuantiles     | A numerical vector of the quantiles used in model building                                     |
| SizeQuantiles      | A numerical vector of the quantiles used in model building                                     |
| ModelPath          | The path file to where you models were saved   |
| ModelIDs           | The ID's used in model building  |
| KeepFeatures       | Set to TRUE to return the features with the predicted values                                   |

**Value**

Returns a list of CountData scores, SizeData scores, along with count and size prediction column names

AutoCatBoostHurdleModel

*AutoCatBoostHurdleModel for generalized hurdle modeling*

---

## Description

AutoCatBoostHurdleModel for generalized hurdle modeling. Check out the Readme.Rd on github for more background.

## Usage

```

AutoCatBoostHurdleModel(
  data = NULL,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  ClassWeights = NULL,
  SplitRatios = c(0.7, 0.2, 0.1),
  task_type = "GPU",
  ModelID = "ModelTest",
  Paths = NULL,
  MetaDataPaths = NULL,
  SaveModelObjects = FALSE,
  ReturnModelObjects = TRUE,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL,
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 1L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 60L * 60L,
  Shuffles = 2L,
  MetricPeriods = 25L,
  Trees = seq(1000L, 5000L, 500L),
  Depth = 6,
  RandomStrength = 1,
  BorderCount = 128,
  LearningRate = seq(0.01, 0.1, 0.01),

```

```

L2_Leaf_Reg = 3,
RSM = c(0.8, 0.85, 0.9, 0.95, 1),
BootStrapType = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),
GrowPolicy = c("SymmetricTree", "Depthwise", "Lossguide")
)

```

### Arguments

|                         |   |
|-------------------------|---|
| data                    | Source training data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| TrainOnFull             | Set to TRUE to use all data   |
| ValidationData          | Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| TestData                | Source test data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| Buckets                 | A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value. |
| TargetColumnName        | Supply the column name or number for the target variable  |
| FeatureColNames         | Supply the column names or number of the features (not included the Primary-DateColumn)   |
| PrimaryDateColumn       | Supply a date column if the data is functionally related to it  |
| IDcols                  | Includes PrimaryDateColumn and any other columns you want returned in the validation data with predictions  |
| TransformNumericColumns | Transform numeric column inside the AutoCatBoostRegression() function   |
| Methods                 | Choose transformation methods   |
| ClassWeights            | Utilize these for the classifier model  |
| SplitRatios             | Supply vector of partition ratios. For example, c(0.70,0.20,0,10).  |
| task_type               | Set to "GPU" or "CPU"   |
| ModelID                 | Define a character name for your models   |
| Paths                   | The path to your folder where you want your model information saved   |
| MetaDataPaths           | TA character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.  |
| SaveModelObjects        | Set to TRUE to save the model objects to file in the folders listed in Paths  |
| ReturnModelObjects      | TRUE to return the models   |
| NumOfParDepPlots        | Set to pull back N number of partial dependence calibration plots.  |
| PassInGrid              | Pass in a grid for changing up the parameter settings for catboost  |
| GridTune                | Set to TRUE if you want to grid tune the models   |
| BaselineComparison      | = "default",  |

```

MaxModelsInGrid      = 1L,
MaxRunsWithoutNewWinner = 20L,
MaxRunMinutes        = 60L*60L,
Shuffles              = 2L,
MetricPeriods        = 25L,
Trees                 = seq(1000L, 5000L, 500L),
Depth                 = seq(4L, 8L, 1L),
RandomStrength        1
BorderCount           128
LearningRate          = seq(0.01,0.10,0.01),

---

AutoCatBoostMultiClass

*AutoCatBoostMultiClass is an automated catboost model grid-tuning multinomial classifier and evaluation system*

---

## Description

AutoCatBoostMultiClass is an automated modeling function that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, variable importance, and column names used in model fitting. You can download the catboost package using devtools, via: `devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')`.

**Usage**

```

AutoCatBoostMultiClass(
    data,
    TrainOnFull = FALSE,
    ValidationData = NULL,
    TestData = NULL,
    TargetColumnName = NULL,
    FeatureColNames = NULL,
    PrimaryDateColumn = NULL,
    ClassWeights = NULL,
    IDcols = NULL,
    task_type = "GPU",
    eval_metric = "MultiClassOneVsAll",
    model_path = NULL,
    metadata_path = NULL,
    ModelID = "FirstModel",
    ReturnModelObjects = TRUE,
    SaveModelObjects = FALSE,
    PassInGrid = NULL,
    GridTune = FALSE,
    MaxModelsInGrid = 10L,
    MaxRunsWithoutNewWinner = 20L,
    MaxRunMinutes = 24L * 60L,
    grid_eval_metric = "Accuracy",
    Shuffles = 1L,
    BaselineComparison = "default",
    MetricPeriods = 10L,
    Trees = 50L,
    Depth = 6,
    LearningRate = NULL,
    L2_Leaf_Reg = NULL,
    RandomStrength = 1,
    BorderCount = 128,
    RSM = NULL,
    BootstrapType = NULL,
    GrowPolicy = NULL
)

```

**Arguments**

|                               |  |
|-------------------------------|--|
| <code>data</code>             | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>      | Set to TRUE to train on full data and skip over evaluation steps   |
| <code>ValidationData</code>   | This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| <code>TestData</code>         | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TargetColumnName</code> | Either supply the target column name OR the column number where the target is located, but not mixed types. Note that the target column needs to be a 0   1 numeric variable.  |

|                         |   |
|-------------------------|---|
| FeatureColNames         | Either supply the feature column names OR the column number where the target is located, but not mixed types. Also, not zero-indexed.   |
| PrimaryDateColumn       | Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling   |
| ClassWeights            | Supply a vector of weights for your target classes. E.g. c(0.25, 1) to weight your 0 class by 0.25 and your 1 class by 1.   |
| IDcols                  | A vector of column names or column numbers to keep in your data but not include in the modeling.  |
| task_type               | Set to "GPU" to utilize your GPU for training. Default is "CPU".  |
| eval_metric             | This is the metric used inside catboost to measure performance on validation data during a grid-tune. MultiClass or MultiClassOneVsAll  |
| model_path              | A character string of your path file to where you want your output saved  |
| metadata_path           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.  |
| ModelID                 | A character string to name your model and output  |
| ReturnModelObjects      | Set to TRUE to output all modeling objects. E.g. plots and evaluation metrics   |
| SaveModelObjects        | Set to TRUE to return all modeling objects to your environment  |
| PassInGrid              | Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)   |
| GridTune                | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.   |
| MaxModelsInGrid         | Number of models to test from grid options.   |
| MaxRunsWithoutNewWinner | A number  |
| MaxRunMinutes           | In minutes  |
| grid_eval_metric        | For evaluating models within grid tuning. Choices include, "accuracy", "microauc", "logloss"  |
| Shuffles                | Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning   |
| BaselineComparison      | Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.   |
| MetricPeriods           | Number of trees to build before evaluating intermediate metrics. Default is 10L   |
| Trees                   | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L) |
| Depth                   | Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)   |

|                |   |
|----------------|---|
| LearningRate   | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)                     |
| L2_Leaf_Reg    | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)                                  |
| RandomStrength | A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.   |
| BorderCount    | Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU   |
| RSM            | CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)                     |
| BootStrapType  | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No") |
| GrowPolicy     | Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")                         |

### Value

Saves to file and returned in list: VariableImportance.csv, Model (the model), ValidationData.csv, EvaluationMetrics.csv, GridCollect, and GridList

AutoCatBoostRegression

*AutoCatBoostRegression is an automated catboost model grid-tuning classifier and evaluation system*

---

## Description

AutoCatBoostRegression is an automated modeling function that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting. You can download the catboost package using devtools, via: `devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')`

**Usage**

```

AutoCatBoostRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  task_type = "GPU",
  NumGPUs = 1,
  eval_metric = "RMSE",
  loss_function = "RMSE",
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 0L,
  EvalPlots = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  PassInGrid = NULL,
  GridTune = FALSE,
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  Shuffles = 1L,
  BaselineComparison = "default",
  MetricPeriods = 10L,
  Trees = 50L,
  Depth = 6,
  L2_Leaf_Reg = 3,
  RandomStrength = 1,
  BorderCount = 128,
  LearningRate = NULL,
  RSM = NULL,
  BootstrapType = NULL,
  GrowPolicy = NULL
)

```

**Arguments**

|                             |  |
|-----------------------------|--|
| <code>data</code>           | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>    | Set to TRUE to train on full data and skip over evaluation steps   |
| <code>ValidationData</code> | This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| <code>TestData</code>       | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |

|                         |  |
|-------------------------|--|
| TargetColumnName        | Either supply the target column name OR the column number where the target is located (but not mixed types).   |
| FeatureColNames         | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| PrimaryDateColumn       | Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling  |
| IDcols                  | A vector of column names or column numbers to keep in your data but not include in the modeling.   |
| TransformNumericColumns | Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed   |
| Methods                 | Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.  |
| task_type               | Set to "GPU" to utilize your GPU for training. Default is "CPU".   |
| NumGPUs                 | Set to 1, 2, 3, etc.   |
| eval_metric             | This is the metric used inside catboost to measure performance on validation data during a grid-tune. "RMSE" is the default, but other options include: "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError". |
| loss_function           | Used in model training for model fitting. Select from 'RMSE', 'MAE', 'Quantile', 'LogLinQuantile', 'MAPE', 'Poisson', 'PairLogitPairwise', 'Tweedie', 'QueryRMSE'  |
| model_path              | A character string of your path file to where you want your output saved   |
| metadata_path           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.   |
| ModelID                 | A character string to name your model and output   |
| NumOfParDepPlots        | Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)  |
| EvalPlots               | Defaults to TRUE. Set to FALSE to not generate and return these objects.   |
| ReturnModelObjects      | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)   |
| SaveModelObjects        | Set to TRUE to return all modeling objects to your environment   |
| PassInGrid              | Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)  |
| GridTune                | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.  |
| MaxModelsInGrid         | Number of models to test from grid options   |
| MaxRunsWithoutNewWinner | Number of models built before calling it quits   |
| MaxRunMinutes           | Maximum number of minutes to let this run  |

|                    |   |
|--------------------|---|
| Shuffles           | Number of times to randomize grid possibilities   |
| BaselineComparison | Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.   |
| MetricPeriods      | Number of periods to use between Catboost evaluations   |
| Trees              | Bandit grid partitioned. The maximum number of trees you want in your models  |
| Depth              | Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)   |
| L2_Leaf_Reg        | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)                                  |
| RandomStrength     | A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.   |
| BorderCount        | Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU   |
| LearningRate       | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)                     |
| RSM                | CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)                     |
| BootStrapType      | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No") |
| GrowPolicy         | Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")                         |

### Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, catboostgrid, and a transformation details file.

AutoCatBoostScoring      *AutoCatBoostScoring*

---

## Description

AutoCatBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions. This function requires you to supply features for scoring. It will run `ModelDataPrep()` to prepare your features for catboost data conversion and scoring.

## Usage

```

AutoCatBoostScoring(
  TargetType = NULL,
  ScoringData = NULL,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  ModelObject = NULL,
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  MultiClassTargetLevels = NULL,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = TRUE,
  MDP_CharToFactor = TRUE,
  MDP_RemoveDates = TRUE,
  MDP_MissFactor = "0",
  MDP_MissNum = -1,
  RemoveModel = FALSE
)

```

**Arguments**

|                        |  |
|------------------------|--|
| TargetType             | Set this value to "regression", "classification", or "multiclass" to score models built using AutoCatBoostRegression(), AutoCatBoostClassify() or AutoCatBoostMultiClass().  |
| ScoringData            | This is your data.table of features for scoring. Can be a single row or batch.   |
| FeatureColumnNames     | Supply either column names or column numbers used in the AutoCatBoostRegression() function   |
| IDcols                 | Supply ID column numbers for any metadata you want returned with your predicted values   |
| ModelObject            | Supply the model object directly for scoring instead of loading it from file. If you supply this, ModelID and ModelPath will be ignored.   |
| ModelPath              | Supply your path file used in the AutoCatBoost__() function  |
| ModelID                | Supply the model ID used in the AutoCatBoost__() function  |
| ReturnFeatures         | Set to TRUE to return your features with the predicted values.   |
| MultiClassTargetLevels | For use with AutoCatBoostMultiClass(). If you saved model objects then this scoring function will locate the target levels file. If you did not save model objects, you can supply the target levels returned from AutoCatBoostMultiClass().                             |
| TransformNumeric       | Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.  |
| BackTransNumeric       | Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.  |
| TargetColumnName       | Input your target column name used in training if you are utilizing the transformation service   |
| TransformationObject   | Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file. |
| TransID                | Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().   |
| TransPath              | Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.   |
| MDP_Impute             | Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function  |
| MDP_CharToFactor       | Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function  |
| MDP_RemoveDates        | Set to TRUE if you have date of timestamp columns in your ScoringData  |
| MDP_MissFactor         | If you set MDP_Impute to TRUE, supply the character values to replace missing values with  |
| MDP_MissNum            | If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with   |
| RemoveModel            | Set to TRUE if you want the model removed immediately after scoring  |

**Value**

A data.table of predicted values with the option to return model features as well.

AutoCatBoostSizeFreqDist

*AutoCatBoostSizeFreqDist*

---

**Description**

AutoCatBoostSizeFreqDist for building size and frequency distributions via quantile regressions. Size (or severity) and frequency (or count) quantile regressions are build. Use this with the Auto-QuantileGibbsSampler function to simulate the joint distribution.

**Usage**

```

AutoCatBoostSizeFreqDist(
  CountData = NULL,
  SizeData = NULL,
  CountQuantiles = seq(0.1, 0.9, 0.1),
  SizeQuantiles = seq(0.1, 0.9, 0.1),
  AutoTransform = TRUE,
  DataPartitionRatios = c(0.75, 0.2, 0.05),
  StratifyColumnNames = NULL,
  NTrees = 1500,
  TaskType = "GPU",
  EvalMetric = "Quantile",
  GridTune = FALSE,
  GridEvalMetric = "mae",
  CountTargetColumnName = NULL,
  SizeTargetColumnName = NULL,
  CountFeatureColNames = NULL,
  SizeFeatureColNames = NULL,
  CountIDcols = NULL,
  SizeIDcols = NULL,
  ModelIDs = c("CountModel", "SizeModel"),
  MaxModelsGrid = 5,
  ModelPath = NULL,
  MetaDataPath = NULL,
  NumOfParDepPlots = 0
)

```

**Arguments**

|                     |  |
|---------------------|--|
| CountData           | This is your CountData generated from the IntermittentDemandBootStrapper() function  |
| SizeData            | This is your SizeData generated from the IntermittentDemandBootStrapper() function   |
| CountQuantiles      | The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.  |
| SizeQuantiles       | The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.  |
| AutoTransform       | Set to FALSE not to have the your target variables automatically transformed for the best normalization.   |
| DataPartitionRatios | The default is c(0.75,0.20,0.05). With CatBoost, you should allocate a decent amount to the validation data (second input). Three inputs are required. |
| StratifyColumnNames | Specify grouping variables to stratify by  |
| NTrees              | Default is 1500. If the best model utilizes all trees, you should consider increasing the argument.  |
| TaskType            | The default is set to "GPU". If you do not have a GPU, set it to "CPU".  |
| EvalMetric          | Set to "Quantile". Alternative quantile methods may become available in the future.  |

|                       |  |
|-----------------------|--|
| GridTune              | The default is set to FALSE. If you set to TRUE, make sure to specify MaxModelsGrid to a number greater than 1.  |
| GridEvalMetric        | The default is set to "mae". Choose from 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'.  |
| CountTargetColumnName | Column names or column numbers   |
| SizeTargetColumnName  | Column names or column numbers   |
| CountFeatureColNames  | Column names or column numbers   |
| SizeFeatureColNames   | Column names or column numbers   |
| CountIDcols           | Column names or column numbers   |
| SizeIDcols            | Column names or column numbers   |
| ModelIDs              | A two element character vector. E.g. c("CountModel","SizeModel")   |
| MaxModelsGrid         | Set to a number greater than 1 if GridTune is set to TRUE  |
| ModelPath             | This path file is where all your models will be stored. If you leave MetaDataPath NULL, the evaluation metadata will also be stored here. If you leave this NULL, the function will not run. |
| MetaDataPath          | A separate path to store the model metadata for evaluation.  |
| NumOfParDepPlots      | Set to a number greater than or equal to 1 to see the relationships between your features and targets.   |

**Value**

This function does not return anything. It can only store your models and model evaluation metadata to file.

AutoDataDictionaries    *AutoDataDictionaries*

---

## Description

AutoDataDictionaries is a function to return data dictionary data in table form

## Usage

```

AutoDataDictionaries(
  Type = "sqlserver",
  DBConnection,
  DDType = 1L,
  Query = NULL,
  ASIS = FALSE,
  CloseChannel = TRUE
)

```

## Arguments

|              |  |
|--------------|--|
| Type         | = "sqlserver" is currently the only system supported |
| DBConnection | This is a RODBC connection object for sql server     |
| DDType       | Select from 1 - 6 based on this article              |
| Query        | Supply a query                                       |
| ASIS         | Set to TRUE to pull in values without coercing types |
| CloseChannel | Set to TRUE to disconnect                            |

|-------------------|--------------------------|
| AutoDataPartition | <i>AutoDataPartition</i> |
|-------------------|--------------------------|

---

## Description

This function will take your ratings matrix and model and score your data in parallel.

## Usage

```
AutoDataPartition(
  data,
  NumDataSets = 3L,
  Ratios = c(0.7, 0.2, 0.1),
  PartitionType = "random",
  StratifyColumnNames = NULL,
  StratifyNumericTarget = NULL,
  StratTargetPrecision = 3L,
  TimeColumnName = NULL
)
```

## Arguments

|                                    |  |
|------------------------------------|--|
| <code>data</code>                  | Source data to do your partitioning on   |
| <code>NumDataSets</code>           | The number of total data sets you want built   |
| <code>Ratios</code>                | A vector of values for how much data each data set should get in each split. E.g. <code>c(0.70, 0.20, 0.10)</code>   |
| <code>PartitionType</code>         | Set to either "random", "timeseries", or "time". With "random", your data will be partitioned randomly (with stratified sampling if column names are supplied). With "timeseries", you can partition by time with a stratify option (so long as you have an equal number of records for each strata). With "time" you will have data sets generated so that the training data contains the earliest records in time, validation data the second earliest, test data the third earliest, etc. |
| <code>StratifyColumnNames</code>   | Supply column names of categorical features to use in a stratified sampling procedure for partitioning the data. Partition type must be "random" to use this option  |
| <code>StratifyNumericTarget</code> | Supply a column name that is numeric. Use for "random" PartitionType, you can stratify your numeric variable by splitting up based on percRank to ensure a proper allocation of extreme values in your created data sets.  |
| <code>StratTargetPrecision</code>  | For "random" PartitionType and when StratifyNumericTarget is not null, precision will be the number of decimals used in the percentile calculation. If you supply a value of 1, deciles will be used. For a value of 2, percentiles will be used. Larger values are supported.   |
| <code>TimeColumnName</code>        | Supply a date column name or a name of a column with an ID for sorting by time such that the smallest number is the earliest in time.  |

**Value**

Returns a list of data.tables

Timer = TRUE,
DebugMode = FALSE
)

```

### Arguments

|                  |  |
|------------------|--|
| data             | Supply your full series data set here  |
| TrainOnFull      | Set to TRUE to train on full data  |
| TargetColumnName | List the column name of your target variables column. E.g. "Target"  |
| DateColumnName   | List the column name of your date column. E.g. "DateTime"  |
| HierarchGroups   | Vector of hierachy categorical columns.  |
| GroupVariables   | Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups. |
| FC_Periods       | Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead   |
| TimeUnit         | List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".      |
| TimeGroups       | Select time aggregations for adding various time aggregated GDL features.  |

|                       |  |
|-----------------------|--|
| TargetTransformation  | Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).   |
| Methods               | Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.  |
| XREGS                 | Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.   |
| Lags                  | Select the periods for all lag variables you want to create. E.g. c(1:5,52)  |
| MA_Periods            | Select the periods for all moving average variables you want to create. E.g. c(1:5,52)   |
| SD_Periods            | Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)  |
| Skew_Periods          | Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)  |
| Kurt_Periods          | Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)  |
| Quantile_Periods      | Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)   |
| Quantiles_Selected    | Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q60")  |
| Difference            | Puts the I in ARIMA for single series and grouped series.  |
| FourierTerms          | Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.   |
| CalendarVariables     | Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year  |
| HolidayVariable       | Set to TRUE to have a holiday counter variable created.  |
| HolidayLags           | Number of lags to build off of the holiday count variable.   |
| HolidayMovingAverages | Number of moving averages to build off of the holiday count variable.  |
| TimeTrendVariable     | Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point. |
| DataTruncate          | Set to TRUE to remove records with missing values from the lags and moving average features created  |
| ZeroPadSeries         | Set to "all", "inner", or NULL. See TimeSeriesFill for explanation   |
| SplitRatios           | E.g c(0.7,0.2,0.1) for train, validation, and test sets  |
| EvalMetric            | Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"  |

|               |  |
|---------------|--|
| GridTune      | Set to TRUE to run a grid tune   |
| ModelCount    | Set the number of models to try in the grid tune   |
| NTrees        | Select the number of trees you want to have built to train the model                               |
| PartitionType | Select "random" for random data partitioning "time" for partitioning by time frames                |
| MaxMem        | Set to the maximum amount of memory you want to allow for running this function. Default is "32G". |
| NThreads      | Set to the number of threads you want to dedicate to this function.                                |
| Timer         | Set to FALSE to turn off the updating print statements for progress                                |
| DebugMode     | Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function     |

### Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

## Description

AutoH2oDRFClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

## Usage

```
AutoH2oDRFClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "auc",
  Trees = 50L,
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

## Arguments

|                               |  |
|-------------------------------|--|
| <code>data</code>             | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>      | Set to TRUE to train on full data  |
| <code>ValidationData</code>   | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>         | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TargetColumnName</code> | Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0   1 numeric variable. |
| <code>FeatureColNames</code>  | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |

|                    |  |
|--------------------|--|
| eval_metric        | This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"  |
| Trees              | The maximum number of trees you want in your models  |
| GridTune           | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.              |
| MaxMem             | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| NThreads           | Set the number of threads you want to dedicate to the model building   |
| MaxModelsInGrid    | Number of models to test from grid options (1080 total possible options)   |
| model_path         | A character string of your path file to where you want your output saved   |
| metadata_path      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path. |
| ModelID            | A character string to name your model and output   |
| NumOfParDepPlots   | Tell the function the number of partial dependence calibration plots you want to create.   |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)   |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment   |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object   |
| H2OShutdown        | Set to TRUE to shutdown H2O after running the function   |
| HurdleModel        | Leave it set to FALSE  |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

    MaxModelsInGrid = 1L,
    NumOfParDepPlots = 10L,
    PassInGrid = NULL
  )

```

### Arguments

|                                      |   |
|--------------------------------------|---|
| <code>data</code>                    | Source training data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| <code>TrainOnFull</code>             | Set to TRUE to train on full data   |
| <code>ValidationData</code>          | Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| <code>TestData</code>                | Source test data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| <code>Buckets</code>                 | A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value. |
| <code>TargetColumnName</code>        | Supply the column name or number for the target variable  |
| <code>FeatureColNames</code>         | Supply the column names or number of the features (not included the Primary-DateColumn)   |
| <code>TransformNumericColumns</code> | Transform numeric column inside the <code>AutoCatBoostRegression()</code> function  |
| <code>SplitRatios</code>             | Supply vector of partition ratios. For example, <code>c(0.70,0.20,0.10)</code> .  |
| <code>ModelID</code>                 | Define a character name for your models   |
| <code>Paths</code>                   | The path to your folder where you want your model information saved   |
| <code>MetaDataPaths</code>           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.   |
| <code>SaveModelObjects</code>        | Set to TRUE to save the model objects to file in the folders listed in Paths  |
| <code>IfSaveModel</code>             | Save as "mojo" or "standard"  |
| <code>MaxMem</code>                  | Set the maximum memory your system can provide  |
| <code>NThreads</code>                | Set the number of threads you want to dedicate to the model building  |
| <code>Trees</code>                   | Default 1000  |

|                  |   |
|------------------|---|
| GridTune         | Set to TRUE if you want to grid tune the models                     |
| MaxModelsInGrid  | Set to a numeric value for the number of models to try in grid tune |
| NumOfParDepPlots | Set to pull back N number of partial dependence calibration plots.  |
| PassInGrid       | Pass in a grid for changing up the parameter settings for catboost  |

### Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, Validation-Data.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoH2oDRFMultiClass    *AutoH2oDRFMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation*

---

## Description

AutoH2oDRFMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, confusion matrix, and variable importance.

## Usage

```
AutoH2oDRFMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "logloss",
  Trees = 50,
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

## Arguments

|                  |  |
|------------------|--|
| data             | This is your data set for training and testing your model  |
| TrainOnFull      | Set to TRUE to train on full data  |
| ValidationData   | This is your holdout data set used in modeling either refine your hyperparameters.   |
| TestData         | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| TargetColumnName | Either supply the target column name OR the column number where the target is located (but not mixed types).   |

|                    |  |
|--------------------|--|
| FeatureColNames    | Either supply the feature column names OR the column number where the target is located (but not mixed types)                                    |
| eval_metric        | This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"  |
| Trees              | The maximum number of trees you want in your models  |
| GridTune           | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.              |
| MaxMem             | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| NThreads           | Set the number of threads you want to dedicate to the model building   |
| MaxModelsInGrid    | Number of models to test from grid options (1080 total possible options)   |
| model_path         | A character string of your path file to where you want your output saved   |
| metadata_path      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path. |
| ModelID            | A character string to name your model and output   |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)   |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment   |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object   |
| H2OShutdown        | Set to TRUE to have H2O shutdown after running this function   |
| HurdleModel        | Leave set to FALSE   |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

## Description

AutoH2oDRFRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

## Usage

```

AutoH2oDRFRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,

```

```

TransformNumericColumns = NULL,
Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
eval_metric = "RMSE",
Trees = 50,
GridTune = FALSE,
MaxMem = "32G",
NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

### Arguments

|                                      |  |
|--------------------------------------|--|
| <code>data</code>                    | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>             | Set to TRUE to train on full data  |
| <code>ValidationData</code>          | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>                | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| <code>TargetColumnName</code>        | Either supply the target column name OR the column number where the target is located (but not mixed types).   |
| <code>FeatureColNames</code>         | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| <code>TransformNumericColumns</code> | Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed   |
| <code>Methods</code>                 | Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.              |
| <code>eval_metric</code>             | This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"   |
| <code>Trees</code>                   | The maximum number of trees you want in your models  |
| <code>GridTune</code>                | Set to TRUE to run a grid tuning procedure. Set a number in <code>MaxModelsInGrid</code> to tell the procedure how many models you want to test.                             |
| <code>MaxMem</code>                  | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| <code>NThreads</code>                | Set the number of threads you want to dedicate to the model building   |
| <code>MaxModelsInGrid</code>         | Number of models to test from grid options (1080 total possible options)   |

|                                 |   |
|---------------------------------|---|
| <code>model_path</code>         | A character string of your path file to where you want your output saved  |
| <code>metadata_path</code>      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to <code>model_path</code> .                  |
| <code>ModelID</code>            | A character string to name your model and output  |
| <code>NumOfParDepPlots</code>   | Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables) |
| <code>ReturnModelObjects</code> | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)  |
| <code>SaveModelObjects</code>   | Set to TRUE to return all modeling objects to your environment  |
| <code>IfSaveModel</code>        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object  |
| <code>H2OShutdown</code>        | For use in other functions.   |
| <code>HurdleModel</code>        | Leave it set to FALSE   |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

    MA_Periods = c(1:5),
    SD_Periods = c(2:5),
    Skew_Periods = c(3:5),
    Kurt_Periods = c(4:5),
    Quantile_Periods = c(3:5),
    Quantiles_Selected = c("q5", "q95"),
    Difference = TRUE,
    FourierTerms = 6,
    CalendarVariables = FALSE,
    HolidayVariable = TRUE,
    HolidayLags = 1,
    HolidayMovingAverages = 1:2,
    TimeTrendVariable = FALSE,
    ZeroPadSeries = NULL,
    DataTruncate = FALSE,
    SplitRatios = c(0.7, 0.2, 0.1),
    MaxMem = "28G",
    NThreads = max(1L, parallel::detectCores() - 2L),
    EvalMetric = "RMSE",
    GridTune = FALSE,
    GridEvalMetric = "mae",
    ModelCount = 1,
    NTrees = 1000,
    PartitionType = "timeseries",
    Timer = TRUE,
    DebugMode = FALSE
)

```

## Arguments

|                                   |  |
|-----------------------------------|--|
| <code>data</code>                 | Supply your full series data set here  |
| <code>TrainOnFull</code>          | Set to TRUE to train on full data  |
| <code>TargetColumnName</code>     | List the column name of your target variables column. E.g. "Target"  |
| <code>DateColumnName</code>       | List the column name of your date column. E.g. "DateTime"  |
| <code>HierarchGroups</code>       | Vector of hierachy categorical columns.  |
| <code>GroupVariables</code>       | Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.           |
| <code>FC_Periods</code>           | Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead   |
| <code>TimeUnit</code>             | List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".                |
| <code>TimeGroups</code>           | Select time aggregations for adding various time aggregated GDL features.  |
| <code>TargetTransformation</code> | Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. See the <code>Methods</code> argument for a listing of methods. |

|                       |  |
|-----------------------|--|
| Methods               | Target transformation methods to test Tests YeoJohnson, BoxCox, Log, Log plus one, and Asigh (also Asin and Logit for proportion target variables).  |
| XREGS                 | Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.   |
| Lags                  | Select the periods for all lag variables you want to create. E.g. c(1:5,52)  |
| MA_Periods            | Select the periods for all moving average variables you want to create. E.g. c(1:5,52)   |
| SD_Periods            | Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)  |
| Skew_Periods          | Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)  |
| Kurt_Periods          | Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)  |
| Quantile_Periods      | Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)   |
| Quantiles_Selected    | Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q60")  |
| Difference            | Puts the I in ARIMA for single series and grouped series.  |
| FourierTerms          | Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.   |
| CalendarVariables     | Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year  |
| HolidayVariable       | Set to TRUE to have a holiday counter variable created.  |
| HolidayLags           | Number of lags to build off of the holiday count variable.   |
| HolidayMovingAverages | Number of moving averages to build off of the holiday count variable.  |
| TimeTrendVariable     | Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point. |
| ZeroPadSeries         | Set to "all", "inner", or NULL. See TimeSeriesFill for explanation   |
| DataTruncate          | Set to TRUE to remove records with missing values from the lags and moving average features created  |
| SplitRatios           | E.g c(0.7,0.2,0.1) for train, validation, and test sets  |
| MaxMem                | Set to the maximum amount of memory you want to allow for running this function. Default is "32G".   |
| NThreads              | Set to the number of threads you want to dedicate to this function.  |
| EvalMetric            | Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"  |
| GridTune              | Set to TRUE to run a grid tune   |

|                |   |
|----------------|---|
| GridEvalMetric | This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2' |
| ModelCount     | Set the number of models to try in the grid tune  |
| NTrees         | Select the number of trees you want to have built to train the model                                    |
| PartitionType  | Select "random" for random data partitioning "time" for partitioning by time frames                     |
| Timer          | Set to FALSE to turn off the updating print statements for progress                                     |
| DebugMode      | Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function          |

**Value**

Returns a data.table of original series and forecasts, the h2o-gbm model objects (everything returned from AutoH2oGBMRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

```

## Description

AutoH2oGBMClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

## Usage

```
AutoH2oGBMClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  eval_metric = "auc",
  Trees = 50L,
  GridTune = FALSE,
  MaxMem = "32G",
  NThreads = max(1L, parallel::detectCores() - 2L),
  MaxModelsInGrid = 2L,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)
```

## Arguments

|                               |  |
|-------------------------------|--|
| <code>data</code>             | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>      | Set to TRUE to train on full data  |
| <code>ValidationData</code>   | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>         | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TargetColumnName</code> | Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0   1 numeric variable. |
| <code>FeatureColNames</code>  | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |

|                    |  |
|--------------------|--|
| eval_metric        | This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"  |
| Trees              | The maximum number of trees you want in your models  |
| GridTune           | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.              |
| MaxMem             | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| NThreads           | Set to the number of threads you want to use for running this function   |
| MaxModelsInGrid    | Number of models to test from grid options (1080 total possible options)   |
| model_path         | A character string of your path file to where you want your output saved   |
| metadata_path      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path. |
| ModelID            | A character string to name your model and output   |
| NumOfParDepPlots   | Tell the function the number of partial dependence calibration plots you want to create.   |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)   |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment   |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object   |
| H2OShutdown        | Set to TRUE to shut down H2O after running the function  |
| HurdleModel        | Set to FALSE   |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoH2oGBMFreqSizeScoring

*AutoH2oGBMFreqSizeScoring is for scoring the models build with  
AutoH2oGBMSizeFreqDist()*

---

## Description

AutoH2oGBMFreqSizeScoring is for scoring the models build with AutoH2oGBMSizeFreqDist(). It will return the predicted values for every quantile model for both distributions for 1 to the max forecast periods you provided to build the scoring data.

## Usage

```
AutoH2oGBMFreqSizeScoring(
```

```

    ScoringData,
    TargetColumnNames = NULL,
    CountQuantiles = seq(0.1, 0.9, 0.1),
    SizeQuantiles = seq(0.1, 0.9, 0.1),
    ModelPath = NULL,
    ModelIDs = c("CountModel", "SizeModel"),
    JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
    KeepFeatures = TRUE
  )

```

### Arguments

|                   |  |
|-------------------|--|
| ScoringData       | The scoring data returned from <code>IntermittentDemandScoringDataGenerator()</code>           |
| TargetColumnNames | A character or numeric vector of the target names. E.g. <code>c("Counts", "TARGET_qty")</code> |
| CountQuantiles    | A numerical vector of the quantiles used in model building                                     |
| SizeQuantiles     | A numerical vector of the quantiles used in model building                                     |
| ModelPath         | The path file to where you models were saved   |
| ModelIDs          | The ID's used in model building  |
| JavaOptions       | For mojo scoring <code>'-Xmx1g -XX:ReservedCodeCacheSize=256m'</code> ,                        |
| KeepFeatures      | Set to TRUE to return the features with the predicted values                                   |

### Value

Returns a list of `CountData` scores, `SizeData` scores, along with count and size prediction column names

  GridTune = TRUE,
  MaxModelsInGrid = 1L,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL
)
```

## Arguments

|                  |   |
|------------------|---|
| data             | Source training data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| ValidationData   | Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| TestData         | Source test data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| Buckets          | A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value. |
| TargetColumnName | Supply the column name or number for the target variable  |
| FeatureColNames  | Supply the column names or number of the features (not included the Primary-DateColumn)   |

|                         |   |
|-------------------------|---|
| TransformNumericColumns | Transform numeric column inside the AutoCatBoostRegression() function   |
| Distribution            | Set to the distribution of choice based on H2O regression documents.  |
| SplitRatios             | Supply vector of partition ratios. For example, c(0.70,0.20,0.10).  |
| ModelID                 | Define a character name for your models   |
| Paths                   | The path to your folder where you want your model information saved   |
| MetaDataPaths           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths. |
| SaveModelObjects        | Set to TRUE to save the model objects to file in the folders listed in Paths  |
| IfSaveModel             | Save as "mojo" or "standard"  |
| MaxMem                  | Set the maximum memory your system can provide  |
| NThreads                | Set the number of threads you want to dedicate to the model building  |
| Trees                   | Default 1000  |
| GridTune                | Set to TRUE if you want to grid tune the models   |
| MaxModelsInGrid         | Set to a numeric value for the number of models to try in grid tune   |
| NumOfParDepPlots        | Set to pull back N number of partial dependence calibration plots.  |
| PassInGrid              | Pass in a grid for changing up the parameter settings for catboost  |

### Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

### Arguments

|                                      |  |
|--------------------------------------|--|
| <code>data</code>                    | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>             | Set to TRUE to train on full data  |
| <code>ValidationData</code>          | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>                | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| <code>TargetColumnName</code>        | Either supply the target column name OR the column number where the target is located (but not mixed types).   |
| <code>FeatureColNames</code>         | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| <code>TransformNumericColumns</code> | Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed   |
| <code>Methods</code>                 | Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.              |
| <code>Alpha</code>                   | This is the quantile value you want to use for quantile regression. Must be a decimal between 0 and 1.   |

|                    |   |
|--------------------|---|
| Distribution       | Choose from gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber"  |
| eval_metric        | This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"  |
| Trees              | The maximum number of trees you want in your models   |
| GridTune           | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.   |
| MaxMem             | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"  |
| NThreads           | Set to the mamimum amount of threads you want to use for this function  |
| MaxModelsInGrid    | Number of models to test from grid options (1080 total possible options)  |
| model_path         | A character string of your path file to where you want your output saved  |
| metadata_path      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.                                |
| ModelID            | A character string to name your model and output  |
| NumOfParDepPlots   | Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables) |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)  |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment  |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object  |
| H2OShutdown        | Set to FALSE to keep H2O running after you build your model   |
| HurdleModel        | Set to FALSE  |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and metadata

AutoH2oGBMSizeFreqDist

*AutoH2oGBMSizeFreqDist for building size and frequency distributions via quantile regressions*

---

## Description

AutoH2oGBMSIZEFreqDist for building size and frequency distributions via quantile regressions.

Size (or severity) and frequency (or count) quantile regressions are build. Use this with the ID\_SingleLevelGibbsSampler function to simulate the joint distribution.

## Usage

```
AutoH2oGBMSIZEFreqDist(
  CountData = NULL,
  SizeData = NULL,
  CountQuantiles = seq(0.1, 0.9, 0.1),
  SizeQuantiles = seq(0.1, 0.9, 0.1),
  AutoTransform = TRUE,
  DataPartitionRatios = c(0.75, 0.2, 0.05),
  StratifyColumnName = NULL,
  StratifyTargets = FALSE,
  NTrees = 1500,
  MaxMem = "28G",
  NThreads = max(1, parallel::detectCores() - 2),
  EvalMetric = "Quantile",
  GridTune = FALSE,
  CountTargetColumnName = NULL,
  SizeTargetColumnName = NULL,
  CountFeatureColNames = NULL,
  SizeFeatureColNames = NULL,
  ModelIDs = c("CountModel", "SizeModel"),
  MaxModelsGrid = 5,
  ModelPath = NULL,
  MetaDataPath = NULL,
  NumOfParDepPlots = 0
)
```

## Arguments

|                     |  |
|---------------------|--|
| CountData           | This is your CountData generated from the IntermittentDemandBootStrapper() function  |
| SizeData            | This is your SizeData generated from the IntermittentDemandBootStrapper() function   |
| CountQuantiles      | The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.  |
| SizeQuantiles       | The default are deciles, i.e. seq(0.10,0.90,0.10). More granularity the better, but it will take longer to run.  |
| AutoTransform       | Set to FALSE not to have the your target variables automatically transformed for the best normalization.   |
| DataPartitionRatios | The default is c(0.75,0.20,0.05). With CatBoost, you should allocate a decent amount to the validation data (second input). Three inputs are required. |
| StratifyColumnName  | You can specify grouping columns to stratify by  |

|                       |  |
|-----------------------|--|
| StratifyTargets       | Set to TRUE to stratify by the target variables to ensure the a more even allocation for potentially highly skewed data  |
| NTrees                | Default is 1500. If the best model utilizes all trees, you should consider increasing the argument.  |
| MaxMem                | The max memory allocation. E.g. "28G"  |
| NThreads              | The max threads to use. E.g. 4   |
| EvalMetric            | Set to "Quantile". Alternative quantile methods may become available in the future.  |
| GridTune              | The default is set to FALSE. If you set to TRUE, make sure to specify MaxModelsGrid to a number greater than 1.  |
| CountTargetColumnName | Column names or column numbers   |
| SizeTargetColumnName  | Column names or column numbers   |
| CountFeatureColNames  | Column names or column numbers   |
| SizeFeatureColNames   | Column names or column numbers   |
| ModelIDs              | A two element character vector. E.g. c("CountModel","SizeModel")   |
| MaxModelsGrid         | Set to a number greater than 1 if GridTune is set to TRUE  |
| ModelPath             | This path file is where all your models will be stored. If you leave MetaDataPath NULL, the evaluation metadata will also be stored here. If you leave this NULL, the function will not run. |
| MetaDataPath          | A separate path to store the model metadata for evaluation.  |
| NumOfParDepPlots      | Set to a number greater than or equal to 1 to see the relationships between your features and targets.   |

**Value**

This function does not return anything. It can only store your models and model evaluation metadata to file.

AutoH2oGLMCARMA

*AutoH2oGLMCARMA*

---

## Description

AutoH2oGLMCARMA Multivariate Forecasting with alendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

## Usage

```

AutoH2oGLMCARMA(
  data,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,
  GroupVariables = NULL,
  FC_Periods = 30,
  TimeUnit = "week",
  TimeGroups = c("weeks", "months"),
  TargetTransformation = FALSE,
  XREGS = NULL,
  Lags = c(1:5),
  MA_Periods = c(1:5),
  SD_Periods = NULL,
  Skew_Periods = NULL,
  Kurt_Periods = NULL,
  Quantile_Periods = NULL,
  Quantiles_Selected = NULL,
  Difference = TRUE,
  FourierTerms = 2,

```

```

CalendarVariables = FALSE,
HolidayVariable = TRUE,
HolidayLags = 1,
HolidayMovingAverages = 2:3,
TimeTrendVariable = FALSE,
ZeroPadSeries = NULL,
DataTruncate = FALSE,
SplitRatios = c(0.7, 0.2, 0.1),
MaxMem = "28G",
NThreads = max(1L, parallel::detectCores() - 2L),
EvalMetric = "RMSE",
GridTune = FALSE,
GridEvalMetric = "mae",
ModelCount = 1,
PartitionType = "timeseries",
Timer = TRUE,
DebugMode = FALSE
)

```

### Arguments

|                                   |  |
|-----------------------------------|--|
| <code>data</code>                 | Supply your full series data set here  |
| <code>TrainOnFull</code>          | Set to TRUE to train on full data  |
| <code>TargetColumnName</code>     | List the column name of your target variables column. E.g. "Target"  |
| <code>DateColumnName</code>       | List the column name of your date column. E.g. "DateTime"  |
| <code>HierarchGroups</code>       | Vector of hierachy categorical columns.  |
| <code>GroupVariables</code>       | Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.   |
| <code>FC_Periods</code>           | Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead   |
| <code>TimeUnit</code>             | List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".  |
| <code>TimeGroups</code>           | Select time aggregations for adding various time aggregated GDL features.  |
| <code>TargetTransformation</code> | Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).                          |
| <code>XREGS</code>                | Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied. |
| <code>Lags</code>                 | Select the periods for all lag variables you want to create. E.g. <code>c(1:5,52)</code>   |
| <code>MA_Periods</code>           | Select the periods for all moving average variables you want to create. E.g. <code>c(1:5,52)</code>  |
| <code>SD_Periods</code>           | Select the periods for all moving standard deviation variables you want to create. E.g. <code>c(1:5,52)</code>   |
| <code>Skew_Periods</code>         | Select the periods for all moving skewness variables you want to create. E.g. <code>c(1:5,52)</code>   |

|                       |  |
|-----------------------|--|
| Kurt_Periods          | Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)  |
| Quantile_Periods      | Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)   |
| Quantiles_Selected    | Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q60","q65","q70","q75","q80","q85","q90","q95","q99")  |
| Difference            | Puts the I in ARIMA for single series and grouped series.  |
| FourierTerms          | Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interactions if hierarchy is enabled.   |
| CalendarVariables     | Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year  |
| HolidayVariable       | Set to TRUE to have a holiday counter variable created.  |
| HolidayLags           | Number of lags to build off of the holiday count variable.   |
| HolidayMovingAverages | Number of moving averages to build off of the holiday count variable.  |
| TimeTrendVariable     | Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point. |
| ZeroPadSeries         | Set to "all", "inner", or NULL. See TimeSeriesFill for explanation   |
| DataTruncate          | Set to TRUE to remove records with missing values from the lags and moving average features created  |
| SplitRatios           | E.g c(0.7,0.2,0.1) for train, validation, and test sets  |
| MaxMem                | Set to the maximum amount of memory you want to allow for running this function. Default is "32G".   |
| NThreads              | Set to the number of threads you want to dedicate to this function.  |
| EvalMetric            | Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"  |
| GridTune              | Set to TRUE to run a grid tune   |
| GridEvalMetric        | This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'  |
| ModelCount            | Set the number of models to try in the grid tune   |
| PartitionType         | Select "random" for random data partitioning "time" for partitioning by time frames  |
| Timer                 | Set to FALSE to turn off the updating print statements for progress  |
| DebugMode             | Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function   |

## Value

Returns a data.table of original series and forecasts, the h2o-gbm model objects (everything returned from AutoH2oGBMRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoH2oGLMClassifier     *AutoH2oGLMClassifier is an automated H2O modeling framework with grid-tuning and model evaluation*

---

## Description

AutoH2oGLMClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

## Usage

```

AutoH2oGLMClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  Distribution = "binomial",
  link = NULL,
  eval_metric = "auc",
  GridTune = FALSE,
  MaxMem = "32G",

```

```

NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = FALSE,
HurdleModel = FALSE
)

```

### Arguments

|                                 |  |
|---------------------------------|--|
| <code>data</code>               | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>        | Set to TRUE to train on full data  |
| <code>ValidationData</code>     | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>           | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TargetColumnName</code>   | Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0   1 numeric variable. |
| <code>FeatureColNames</code>    | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| <code>Distribution</code>       | "binomial", "quasibinomial"  |
| <code>link</code>               | identity, logit, log, inverse, tweedie   |
| <code>eval_metric</code>        | This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"  |
| <code>GridTune</code>           | Set to TRUE to run a grid tuning procedure. Set a number in <code>MaxModelsInGrid</code> to tell the procedure how many models you want to test.                               |
| <code>MaxMem</code>             | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| <code>NThreads</code>           | Set the number of threads you want to dedicate to the model building   |
| <code>MaxModelsInGrid</code>    | Number of models to test from grid options (1080 total possible options)   |
| <code>model_path</code>         | A character string of your path file to where you want your output saved   |
| <code>metadata_path</code>      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to <code>model_path</code> .                 |
| <code>ModelID</code>            | A character string to name your model and output   |
| <code>NumOfParDepPlots</code>   | Tell the function the number of partial dependence calibration plots you want to create.   |
| <code>ReturnModelObjects</code> | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)   |

|                  |  |
|------------------|--|
| SaveModelObjects | Set to TRUE to return all modeling objects to your environment                             |
| IfSaveModel      | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object |
| H2OShutdown      | Set to TRUE to shutdown H2O after running the function                                     |
| HurdleModel      | Set to FALSE   |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

|----------------------|--|
| AutoH2oGLMRegression | <i>AutoH2oGLMRegression is an automated H2O modeling framework with grid-tuning and model evaluation</i> |
|----------------------|--|

---

## Description

AutoH2oGLMRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

## Usage

```

AutoH2oGLMRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  Distribution = "binomial",
  link = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),

```

```

eval_metric = "RMSE",
GridTune = FALSE,
MaxMem = "32G",
NThreads = max(1, parallel::detectCores() - 2),
MaxModelsInGrid = 2,
model_path = NULL,
metadata_path = NULL,
ModelID = "FirstModel",
NumOfParDepPlots = 3,
ReturnModelObjects = TRUE,
SaveModelObjects = FALSE,
IfSaveModel = "mojo",
H2OShutdown = TRUE,
HurdleModel = FALSE
)

```

### Arguments

|                         |  |
|-------------------------|--|
| data                    | This is your data set for training and testing your model  |
| TrainOnFull             | Set to TRUE to train on full data  |
| ValidationData          | This is your holdout data set used in modeling either refine your hyperparameters.   |
| TestData                | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| TargetColumnName        | Either supply the target column name OR the column number where the target is located (but not mixed types).   |
| FeatureColNames         | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| Distribution            | "binomial", "quasibinomial"  |
| link                    | identity, logit, log, inverse, tweedie   |
| TransformNumericColumns | Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed   |
| Methods                 | Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "Yeo-Johnson". Function will determine if one cannot be used because of the underlying data.              |
| eval_metric             | This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"   |
| GridTune                | Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.  |
| MaxMem                  | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| NThreads                | Set the number of threads you want to dedicate to the model building   |
| MaxModelsInGrid         | Number of models to test from grid options (1080 total possible options)   |
| model_path              | A character string of your path file to where you want your output saved   |

|                    |   |
|--------------------|---|
| metadata_path      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.                                |
| ModelID            | A character string to name your model and output  |
| NumOfParDepPlots   | Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables) |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)  |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment  |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object  |
| H2OShutdown        | For use in other functions.   |
| HurdleModel        | Set to FALSE  |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

Timer = TRUE,
DebugMode = FALSE
)

```

### Arguments

|                                   |  |
|-----------------------------------|--|
| <code>data</code>                 | Supply your full series data set here  |
| <code>TrainOnFull</code>          | Set to TRUE to train on full data  |
| <code>TargetColumnName</code>     | List the column name of your target variables column. E.g. "Target"  |
| <code>DateColumnName</code>       | List the column name of your date column. E.g. "DateTime"  |
| <code>HierarchGroups</code>       | Vector of hierachy categorical columns.  |
| <code>GroupVariables</code>       | Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.   |
| <code>FC_Periods</code>           | Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead   |
| <code>TimeUnit</code>             | List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".  |
| <code>TimeGroups</code>           | Select time aggregations for adding various time aggregated GDL features.  |
| <code>TargetTransformation</code> | Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).                          |
| <code>XREGS</code>                | Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied. |

|                       |  |
|-----------------------|--|
| Lags                  | Select the periods for all lag variables you want to create. E.g. c(1:5,52)  |
| MA_Periods            | Select the periods for all moving average variables you want to create. E.g. c(1:5,52)   |
| SD_Periods            | Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)  |
| Skew_Periods          | Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)  |
| Kurt_Periods          | Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)  |
| Quantile_Periods      | Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)   |
| Quantiles_Selected    | Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q60")  |
| Difference            | Puts the I in ARIMA for single series and grouped series.  |
| FourierTerms          | Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and iterations if hierarchy is enabled.   |
| CalendarVariables     | Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year  |
| HolidayVariable       | Set to TRUE to have a holiday counter variable created.  |
| HolidayLags           | Number of lags to build off of the holiday count variable.   |
| HolidayMovingAverages | Number of moving averages to build off of the holiday count variable.  |
| TimeTrendVariable     | Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point. |
| ZeroPadSeries         | Set to "all", "inner", or NULL. See TimeSeriesFill for explanation   |
| DataTruncate          | Set to TRUE to remove records with missing values from the lags and moving average features created  |
| SplitRatios           | E.g c(0.7,0.2,0.1) for train, validation, and test sets  |
| Trees                 | For tree models  |
| MaxMem                | Set to the maximum amount of memory you want to allow for running this function. Default is "32G".   |
| NThreads              | Set to the number of threads you want to dedicate to this function.  |
| EvalMetric            | Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"  |
| GridTune              | Keep set to FALSE. I need to investigate how to do this more efficiently with this function  |
| ModelCount            | Number of models   |
| PartitionType         | Select "random" for random data partitioning "time" for partitioning by time frames  |
| Timer                 | Set to FALSE to turn off the updating print statements for progress  |
| DebugMode             | Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function   |

**Value**

Returns a data.table of original series and forecasts, the h2o-gbm model objects (everything returned from AutoH2oGBMRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

| AutoH2oMLClassifier | <i>AutoH2oMLClassifier is an automated H2O modeling framework with grid-tuning and model evaluation</i> |
|---------------------|---|

---

## Description

AutoH2oMLClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

## Usage

```

AutoH2oMLClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,

```

```

    TargetColumnName = NULL,
    FeatureColNames = NULL,
    ExcludeAlgos = NULL,
    eval_metric = "auc",
    Trees = 50,
    MaxMem = "32G",
    NThreads = max(1, parallel::detectCores() - 2),
    MaxModelsInGrid = 2,
    model_path = NULL,
    metadata_path = NULL,
    ModelID = "FirstModel",
    NumOfParDepPlots = 3,
    ReturnModelObjects = TRUE,
    SaveModelObjects = FALSE,
    IfSaveModel = "mojo",
    H2OShutdown = FALSE,
    HurdleModel = FALSE
)

```

### Arguments

|                               |  |
|-------------------------------|--|
| <code>data</code>             | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>      | Set to TRUE to train on full data  |
| <code>ValidationData</code>   | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>         | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.   |
| <code>TargetColumnName</code> | Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0   1 numeric variable. |
| <code>FeatureColNames</code>  | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| <code>ExcludeAlgos</code>     | "DRF", "GLM", "XGBoost", "GBM", "DeepLearning" and "StackedEnsemble"   |
| <code>eval_metric</code>      | This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"  |
| <code>Trees</code>            | The maximum number of trees you want in your models  |
| <code>MaxMem</code>           | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| <code>NThreads</code>         | Set the number of threads you want to dedicate to the model building   |
| <code>MaxModelsInGrid</code>  | Number of models to test from grid options (1080 total possible options)   |
| <code>model_path</code>       | A character string of your path file to where you want your output saved   |
| <code>metadata_path</code>    | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.                               |
| <code>ModelID</code>          | A character string to name your model and output   |

|                    |  |
|--------------------|--|
| NumOfParDepPlots   | Tell the function the number of partial dependence calibration plots you want to create.   |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)             |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment                             |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object |
| H2OShutdown        | Set to TRUE to shutdown H2O after running the function                                     |
| HurdleModel        | Set to FALSE   |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

|---------------------|---|
| AutoH2oMLMultiClass | <i>AutoH2oMLMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation</i> |
|---------------------|---|

---

## Description

AutoH2oDRFMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, confusion matrix, and variable importance.

## Usage

```

AutoH2oMLMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  ExcludeAlgos = NULL,
  eval_metric = "logloss",
  Trees = 50,
  MaxMem = "32G",
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  HurdleModel = FALSE
)

```

## Arguments

|             |   |
|-------------|---|
| data        | This is your data set for training and testing your model |
| TrainOnFull | Set to TRUE to train on full data                         |

|                    |  |
|--------------------|--|
| ValidationData     | This is your holdout data set used in modeling either refine your hyperparameters.   |
| TestData           | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |
| TargetColumnName   | Either supply the target column name OR the column number where the target is located (but not mixed types).   |
| FeatureColNames    | Either supply the feature column names OR the column number where the target is located (but not mixed types)  |
| ExcludeAlgos       | "DRF","GLM","XGBoost","GBM","DeepLearning" and "StackedEnsemble"   |
| eval_metric        | This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"  |
| Trees              | The maximum number of trees you want in your models  |
| MaxMem             | Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"   |
| NThreads           | Set the number of threads you want to dedicate to the model building   |
| MaxModelsInGrid    | Number of models to test from grid options (1080 total possible options)   |
| model_path         | A character string of your path file to where you want your output saved   |
| metadata_path      | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.                             |
| ModelID            | A character string to name your model and output   |
| ReturnModelObjects | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)   |
| SaveModelObjects   | Set to TRUE to return all modeling objects to your environment   |
| IfSaveModel        | Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object   |
| H2OShutdown        | Set to TRUE to have H2O shutdown after running this function   |
| HurdleModel        | Set to FALSE   |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

AutoH2OMLScoring

*AutoH2OMLScoring is an automated scoring function that compliments the AutoH2o model training functions.*

---

## Description

AutoH2OMLScoring is an automated scoring function that compliments the AutoH2oGBM\_\_() and AutoH2oDRF\_\_() models training functions. This function requires you to supply features for scoring. It will run ModelDataPrep() to prepare your features for H2O data conversion and scoring.

## Usage

```

AutoH2OMLScoring(
  ScoringData = NULL,
  ModelObject = NULL,
  ModelType = "mojo",
  H2OShutdown = TRUE,
  MaxMem = "28G",
  NThreads = max(1, parallel::detectCores() - 2),
  JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = TRUE,
  MDP_CharToFactor = TRUE,

```

```

MDP_RemoveDates = TRUE,
MDP_MissFactor = "0",
MDP_MissNum = -1
)

```

## Arguments

|                      |  |
|----------------------|--|
| ScoringData          | This is your data.table of features for scoring. Can be a single row or batch.   |
| ModelObject          | Supply a model object from AutoH2oDRF__()  |
| ModelType            | Set to either "mojo" or "standard" depending on which version you saved  |
| H2OShutdown          | Set to TRUE is you are scoring a "standard" model file and you aren't planning on continuing to score.   |
| MaxMem               | Set to you dedicated amount of memory. E.g. "28G"  |
| NThreads             | Default set to max(1, parallel::detectCores()-2)   |
| JavaOptions          | Change the default to your machines specification if needed. Default is '-Xmx1g -XX:ReservedCodeCacheSize=256m',   |
| ModelPath            | Supply your path file used in the AutoH2o__() function   |
| ModelID              | Supply the model ID used in the AutoH2o__() function   |
| ReturnFeatures       | Set to TRUE to return your features with the predicted values.   |
| TransformNumeric     | Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.  |
| BackTransNumeric     | Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.  |
| TargetColumnName     | Input your target column name used in training if you are utilizing the transformation service   |
| TransformationObject | Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file. |
| TransID              | Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().   |
| TransPath            | Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.   |
| MDP_Impute           | Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function  |
| MDP_CharToFactor     | Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function  |
| MDP_RemoveDates      | Set to TRUE if you have date of timestamp columns in your ScoringData  |
| MDP_MissFactor       | If you set MDP_Impute to TRUE, supply the character values to replace missing values with  |
| MDP_MissNum          | If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with   |

**Value**

A data.table of predicted values with the option to return model features as well.

## End(Not run)
```

**Description**

Steps in the function include: See details below for information on using this function.

**Usage**

```
AutoH2OModeler(
  Construct,
  max_memory = "28G",
  ratios = 0.8,
```

```

    BL_Trees = 500,
    nthreads = 1,
    model_path = NULL,
    MaxRuntimeSeconds = 3600,
    MaxModels = 30,
    TrainData = NULL,
    TestData = NULL,
    SaveToFile = FALSE,
    ReturnObjects = TRUE
)

```

### Arguments

|                   |   |
|-------------------|---|
| Construct         | Core instruction file for automation (see Details below for more information on this) |
| max_memory        | The ceiling amount of memory H2O will utilize   |
| ratios            | The percentage of train samples from source data (remainder goes to validation set)   |
| BL_Trees          | The number of trees to build in baseline GBM or RandomForest                          |
| nthreads          | Set the number of threads to run function   |
| model_path        | Directory path for where you want your models saved                                   |
| MaxRuntimeSeconds | Number of seconds of run time for grid tuning   |
| MaxModels         | Number of models you'd like to have returned  |
| TrainData         | Set to NULL or supply a data.table for training data                                  |
| TestData          | Set to NULL or supply a data.table for validation data                                |
| SaveToFile        | Set to TRUE to save models and output to model_path                                   |
| ReturnObjects     | Set to TRUE to return objects from function   |

### Details

1. Logic: Error checking in the modeling arguments from your Construction file
2. ML: Build grid-tuned models and baseline models for comparison and checks which one performs better on validation data
3. Evaluation: Collects the performance metrics for both
4. Evaluation: Generates calibration plots (and boxplots for regression) for the winning model
5. Evaluation: Generates partial dependence calibration plots (and boxplots for regression) for the winning model
6. Evaluation: Generates variable importance tables and a table of non-important features
7. Production: Creates a storage file containing: model name, model path, grid tune performance, baseline performance, and threshold (if classification) and stores that file in your model\_path location

The Construct file must be a data.table and the columns need to be in the correct order (see examples). Character columns must be converted to type "Factor". You must remove date columns or convert them to "Factor". For classification models, your target variable needs to be a (0,1) of type "Factor." See the examples below for help with setting up the Construct file for various modeling target variable types. There are examples for regression, classification, multinomial, and quantile

regression. For help on which parameters to use, look up the r/h2o documentation. If you misspecify the construct file, it will produce an error and outpufle of what was wrong and suggestions for fixing the error.

Let's go over the construct file, column by column. The Targets column is where you specify the column number of your target variable (in quotes, e.g. "c(1)").

The Distribution column is where you specify the distribution type for the modeling task. For classification use bernoulli, for multilabel use multinomial, for quantile use quantile, and for regression, you can choose from the list available in the H2O docs, such as gaussian, poisson, gamma, etc. It's not set up to handle tweedie distributions currently but I can add support if there is demand.

The Loss column tells H2O which metric to use for the loss metrics. For regression, I typically use "mse", quantile regression, "mae", classification "auc", and multinomial "logloss". For deeplearning models, you need to use "quadratic", "absolute", and "crossentropy".

The Quantile column tells H2O which quantile to use for quantile regression (in decimal form).

The ModelName column is the name you wish to give your model as a prefix.

The Algorithm column is the model you wish to use: gbm, randomForest, deeplearning, AutoML, XGBoost, LightGBM.

The dataName column is the name of your data.

The TargetCol column is the column number of your target variable.

The FeatureCols column is the column numbers of your features.

The CreateDate column is for tracking your model build dates.

The GridTune column is a TRUE / FALSE column for whether you want to run a grid tune model for comparison.

The ExportValidData column is a TRUE / FALSE column indicating if you want to export the validation data.

The ParDep column is where you put the number of partial dependence calibration plots you wish to generate.

The PD\_Data column is where you specify if you want to generate the partial dependence plots on "All" data, "Validate" data, or "Train" data.

The ThreshType column is for classification models. You can specify "f1", "f2", "f0point5", or "CS" for cost sensitive.

The FSC column is the feature selection column. Specify the percentage importance cutoff to create a table of "unimportant" features.

The tpProfit column is for when you specify "CS" in the ThreshType column. This is your true positive profit.

The tnProfit column is for when you specify "CS" in the ThreshType column. This is your true negative profit.

The fpProfit column is for when you specify "CS" in the ThreshType column. This is your false positive profit.

The fnProfit column is for when you specify "CS" in the ThreshType column. This is your false negative profit.

The SaveModel column is a TRUE / FALSE indicator. If you are just testing out models, set this to FALSE.

The SaveModelType column is where you specify if you want a "standard" model object saved or a "mojo" model object saved.

AutoH2OScoring

*AutoH2OScoring is the complement of AutoH20Modeler.*

---

## Description

AutoH2OScoring is the complement of AutoH20Modeler. Use this for scoring models. You can score regression, quantile regression, classification, multinomial, clustering, and text models (built with the Word2VecModel function). You can also use this to score multioutcome models so long as there are two models: one for predicting the count of outcomes (a count outcome in character form) and a multinomial model on the label data. You will want to ensure you have a record for each label in your training data in (0,1) as factor form.

## Usage

```

AutoH2OScoring(
  Features = data,
  GridTuneRow = c(1:3),
  ScoreMethod = "Standard",
  TargetType = rep("multinomial", 3),
  ClassVals = rep("probs", 3),
  TextType = "individual",
  TextNames = NULL,
  NThreads = 6,
  MaxMem = "28G",
  JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
  SaveToFile = FALSE,
  FilesPath = NULL,
  H20ShutDown = rep(FALSE, 3)
)

```

## Arguments

|             |   |
|-------------|---|
| Features    | This is a data.table of features for scoring.   |
| GridTuneRow | Numeric. The row numbers of grid_tuned_paths, KMeansModelFile, or Store-File containing the model you wish to score |

|             |   |
|-------------|---|
| ScoreMethod | "Standard" or "Mojo": Mojo is available for supervised models; use standard for all others  |
| TargetType  | "Regression", "Classification", "Multinomial", "MultiOutcome", "Text", "Clustering". MultiOutcome must be two multinomial models, a count model (the count of outcomes, as a character value), and the multinomial model predicting the labels. |
| ClassVals   | Choose from "p1", "Probs", "Label", or "All" for classification and multinomial models.   |
| TextType    | "Individual" or "Combined" depending on how you build your word2vec models  |
| TextNames   | Column names for the text columns to convert to word2vec  |
| NThreads    | Number of available threads for H2O   |
| MaxMem      | Amount of memory to dedicate to H2O   |
| JavaOptions | Modify to your machine if the default doesn't work  |
| SaveToFile  | Set to TRUE if you want your model scores saved to file.  |
| FilePath    | Set this to the folder where your models and model files are saved  |
| H2OShutDown | TRUE to shutdown H2O after the run. Use FALSE if you will be repeatedly scoring and shutdown somewhere else in your environment.  |

**Value**

Returns a list of predicted values. Each list element contains the predicted values from a single model predict call.

AutoH2OTextPrepScoring
```

```
AutoH2OTextPrepScoring is for NLP scoring
```

---

## Description

This function returns prepared tokenized data for H2O Word2VecModeler scoring

## Usage

```
AutoH2OTextPrepScoring(  
  data,  
  string = NULL,  
  MaxMem = NULL,  
  NThreads = NULL,  
  StartH2O = TRUE  
)
```

## Arguments

|          |  |
|----------|--|
| data     | The text data                                      |
| string   | The name of the string column to prepare           |
| MaxMem   | Amount of memory you want to let H2O utilize       |
| NThreads | The number of threads you want to let H2O utilize  |
| StartH2O | Set to TRUE to have H2O start inside this function |

AutoHierarchicalFourier

*AutoHierarchicalFourier*

---

## Description

AutoHierarchicalFourier reverses the difference

## Usage

```
AutoHierarchicalFourier(
  datax = data,
  xRegs = names(XREGS),
  FourierTermS = FourierTerms,
  TimeUnit = TimeUnit,
  FC_PeriodS = FC_Periods,
  TargetColumnN = TargetColumn,
  DateColumnN = DateColumnName,
  HierarchGroups = NULL,
  IndependentGroups = NULL
)
```

## Arguments

|                   |  |
|-------------------|--|
| datax             | data   |
| xRegs             | The XREGS  |
| FourierTermS      | Number of fourier pairs                                      |
| TimeUnit          | Time unit  |
| FC_PeriodS        | Number of forecast periods                                   |
| TargetColumnN     | Target column name   |
| DateColumnN       | Date column name   |
| HierarchGroups    | Character vector of categorical columns to fully interact    |
| IndependentGroups | Character vector of categorical columns to run independently |

| AutoHurdleScoring | <i>AutoHurdleScoring()</i> |
|-------------------|----------------------------|

---

## Description

AutoHurdleScoring() can score AutoCatBoostHurdleModel() and AutoXGBoostHurdleModel()

## Usage

```
AutoHurdleScoring(
  TestData = NULL,
  Path = NULL,
  ModelID = NULL,
  ModelClass = "catboost",
  ArgList = NULL,
  ModelList = NULL
)
```

## Arguments

|            |   |
|------------|---|
| TestData   | scoring data.table  |
| Path       | Supply if ArgList is NULL or ModelList is null.                                 |
| ModelID    | Supply if ArgList is NULL or ModelList is null. Same as used in model training. |
| ModelClass | Name of model type. "catboost" is currently the only available option           |
| ArgList    | Output from the hurdle model  |
| ModelList  | Output from the hurdle model  |

## Value

A data.table with the final predicted value, the intermediate model predictions, and your source data

AutoKMeans

*AutoKMeans Automated row clustering for mixed column types***Description**

AutoKMeans adds a column to your original data with a cluster number identifier. Uses glm (grid tune-able) and then k-means to find optimal k.

**Usage**

```

AutoKMeans(
  data,
  nthreads = 8,
  MaxMem = "28G",
  SaveModels = NULL,
  PathFile = NULL,
  GridTuneGLRM = TRUE,
  GridTuneKMeans = TRUE,
  glmCols = c(1:5),
  IgnoreConstCols = TRUE,
  glmFactors = 5,
  Loss = "Absolute",
  glmMaxIters = 1000,
  SVDMethod = "Randomized",
  MaxRunTimeSecs = 3600,
  KMeansK = 50,
  KMeansMetric = "totss"
)

```

**Arguments**

|            |  |
|------------|--|
| data       | is the source time series data.table                         |
| nthreads   | set based on number of threads your machine has available    |
| MaxMem     | set based on the amount of memory your machine has available |
| SaveModels | Set to "standard", "mojo", or NULL (default)                 |
| PathFile   | Set to folder where you will keep the models                 |

|                 |  |
|-----------------|--|
| GridTuneGLRM    | If you want to grid tune the glrm model, set to TRUE, FALSE otherwise                      |
| GridTuneKMeans  | If you want to grid tune the KMeans model, set to TRUE, FALSE otherwise                    |
| glrmCols        | the column numbers for the glrm  |
| IgnoreConstCols | tell H2O to ignore any columns that have zero variance                                     |
| glrmFactors     | similar to the number of factors to return from PCA  |
| Loss            | set to one of "Quadratic", "Absolute", "Huber", "Poisson", "Hinge", "Logistic", "Periodic" |
| glrmMaxIters    | max number of iterations   |
| SVDMethod       | choose from "Randomized", "GramSVD", "Power"   |
| MaxRunTimeSecs  | set the timeout for max run time   |
| KMeansK         | number of factors to test out in k-means to find the optimal number                        |
| KMeansMetric    | pick the metric to identify top model in grid tune c("totss", "betweeness", "withinss")    |

### Value

AutoLagRollStats

*AutoLagRollStats*

---

## Description

AutoLagRollStats Builds lags and a large variety of rolling statistics with options to generate them for hierarchical categorical interactions.

## Usage

```

AutoLagRollStats(
  data,
  Targets = NULL,
  HierarchyGroups = NULL,
  IndependentGroups = NULL,
  DateColumn = NULL,
  TimeUnit = "day",
  TimeUnitAgg = "day",
  TimeGroups = "day",
  TimeBetween = NULL,
  RollOnLag1 = TRUE,
  Type = "Lag",
  SimpleImpute = TRUE,
  Lags = c(1:5),
  MA_RollWindows = c(2, 5, 10),
  SD_RollWindows = c(5, 10),
  Skew_RollWindows = c(5, 10),
  Kurt_RollWindows = c(5, 10),
  Quantile_RollWindows = c(10),
  Quantiles_Selected = c("q25", "q75"),
  Debug = FALSE
)

```

## Arguments

|                 |  |
|-----------------|--|
| data            | A data.table you want to run the function on   |
| Targets         | A character vector of the column names for the reference column in which you will build your lags and rolling stats  |
| HierarchyGroups | A vector of categorical column names that you want to have generate all lags and rolling stats done for the individual columns and their full set of interactions. |

|                      |   |
|----------------------|---|
| IndependentGroups    | A vector of categorical column names that you want to have run independently of each other. This will mean that no interaction will be done.  |
| DateColumn           | The column name of your date column used to sort events over time   |
| TimeUnit             | List the time aggregation level for the time between events features, such as "hour", "day", "weeks", "months", "quarter", or "year"  |
| TimeUnitAgg          | List the time aggregation of your data that you want to use as a base time unit for your features. E.g. "raw" or "day"  |
| TimeGroups           | A vector of TimeUnits indicators to specify any time-aggregated GDL features you want to have returned. E.g. c("raw" (no aggregation is done), "hour", "day", "week", "month", "quarter", "year") |
| TimeBetween          | Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.  |
| RollOnLag1           | Set to FALSE to build rolling stats off of target columns directly or set to TRUE to build the rolling stats off of the lag-1 target  |
| Type                 | List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values   |
| SimpleImpute         | Set to TRUE for factor level imputation of "0" and numeric imputation of -1   |
| Lags                 | A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.   |
| MA_RollWindows       | A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.   |
| SD_RollWindows       | A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.   |
| Skew_RollWindows     | A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.   |
| Kurt_RollWindows     | A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.   |
| Quantile_RollWindows | A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.   |
| Quantiles_Selected   | Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95")                                   |
| Debug                | Set to TRUE to get a print of which steps are running   |

**Value**

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

*AutoLimeAid automated lime*

---

## Description

AutoLimeAid automated lime explanations and lime model builds.

## Usage

```

AutoLimeAid(
  EvalPredsData = data,
  LimeTrainingData = data,
  LimeBins = 10,
  LimeIterations = 7500,
  LimeNumFeatures = 0,
  LimeModel = NULL,
  LimeModelPath = NULL,
  LimeModelID = NULL,
  MLModel = NULL,
  MLModelPath = NULL,
  MLMetaDataPath = NULL,
  MLModelID = NULL,

```

```

ModelType = "xgboost",
TargetType = "classification",
NThreads = parallel::detectCores(),
MaxMem = "32G",
FeatureColumnNames = TestModel$ColNames,
IDcols = NULL,
FactorLevelsList = TestModel$FactorLevels,
TargetLevels = NULL,
OneHot = FALSE,
ReturnFeatures = TRUE,
TransformNumeric = FALSE,
BackTransNumeric = FALSE,
TargetColumnName = NULL,
TransformationObject = NULL,
TransID = NULL,
TransPath = NULL,
MDP_Impute = TRUE,
MDP_CharToFactor = TRUE,
MDP_RemoveDates = TRUE,
MDP_MissFactor = "0",
MDP_MissNum = -1
)

```

### Arguments

|                  |  |
|------------------|--|
| EvalPredsData    | Data used for interpretation. Should be the same kind of data used on ML_Scoring functions.  |
| LimeTrainingData | Data used to train your ML model   |
| LimeBins         | Number of bins to use for bucketing numeric variables  |
| LimeIterations   | Number of lime permutations ran to generate interpretation of predicted value  |
| LimeNumFeatures  | How many features do you want to be considering for the Lime evaluation? Set to 0 to use all features  |
| LimeModel        | Supply a model if you have one available. Otherwise, provide a model path and either it will be pulling in or made and saved there.  |
| LimeModelPath    | Supply a path to where your model is located or to be stored.  |
| LimeModelID      | Provide a name for your model. If left NULL, a name will be created for you (and a new model).   |
| MLModel          | Supply the model object (except for H2O models). Can leave null.   |
| MLModelPath      | Supply a path to where your model is located. If this is supplied, the model will be pulled in from file (even if you supply a model)                                      |
| MLMetaDataPath   | Supply a path to where your model metadata is located (might be the same of the MLModelPath). If this is supplied, artifacts about the model will be pulled in from there. |
| MLModelID        | The name of your model as read in the file directory   |
| ModelType        | Choose from "xgboost", "h2o", "catboost"   |
| TargetType       | For catboost models only. Select from "classification", "regression", "multi-class"  |

|                      |   |
|----------------------|---|
| NThreads             | Number of CPU threads.  |
| MaxMem               | Set the max memory you want to allocate. E.g. "32G"   |
| FeatureColumnNames   | The names of the features used in training your ML model (should be returned with the model or saved to file) |
| IDcols               | The ID columns used in either CatBoost or XGBoost   |
| FactorLevelsList     | = TestModel\$FactorLevels,  |
| TargetLevels         | The target levels used in MultiClass models   |
| OneHot               | Replicate what you did with the model training  |
| ReturnFeatures       | TRUE or FALSE   |
| TransformNumeric     | Replicate what you did with the model training  |
| BackTransNumeric     | TRUE or FALSE. Replicate what you did with the model training.  |
| TargetColumnName     | For the transformations   |
| TransformationObject | TRUE or FALSE. Replicate what you did with the model training.  |
| TransID              | Set to the ID used in model training.   |
| TransPath            | Same path used in model training.   |
| MDP_Impute           | Replicate what you did with the model training.   |
| MDP_CharToFactor     | Replicate what you did with the model training.   |
| MDP_RemoveDates      | Replicate what you did with the model training.   |
| MDP_MissFactor       | Replicate what you did with the model training.   |
| MDP_MissNum          | Replicate what you did with the model training.   |

---

AutoMarketBasketModel *AutoMarketBasketModel function runs a market basket analysis automatically*

---

## Description

AutoMarketBasketModel function runs a market basket analysis automatically. It will convert your data, run the algorithm, and add on additional significance values not originally contained within.

## Usage

```

AutoMarketBasketModel(
  data,
  OrderIDColumnName,
  ItemIDColumnName,
  LHS_Delimeter = ",",

```

```

Support = 0.001,
Confidence = 0.1,
MaxLength = 2,
MinLength = 2,
MaxTime = 5
)

```

### Arguments

|                   |  |
|-------------------|--|
| data              | This is your transactions data set   |
| OrderIDColumnName | Supply your column name for the Order ID Values                                  |
| ItemIDColumnName  | Supply your column name for the Item ID Values                                   |
| LHS_Delimiter     | Default delimiter for separating multiple ItemID's is a comma.                   |
| Support           | Threshold for inclusion using support  |
| Confidence        | Threshold for inclusion using confidence   |
| MaxLength         | Maximum combinations of Item ID (number of items in basket to consider)          |
| MinLength         | Minimum length of combinations of ItemID (number of items in basket to consider) |
| MaxTime           | Max run time per iteration (default is 5 seconds)                                |

AutoNLS

*AutoNLS is a function for automatically building nls models***Description**

This function will build models for 9 different nls models, along with a non-parametric monotonic regression and a polynomial regression. The models are evaluated, a winner is picked, and the predicted values are stored in your data table.

**Usage**

```
AutoNLS(data, y, x, monotonic = TRUE)
```

**Arguments**

|           |  |
|-----------|--|
| data      | Data is the data table you are building the modeling on  |
| y         | Y is the target variable name in quotes  |
| x         | X is the independent variable name in quotes   |
| monotonic | This is a TRUE/FALSE indicator - choose TRUE if you want monotonic regression over polynomial regression |

**Value**

A list containing "PredictionData" which is a data table with your original column replaced by the nls model predictions; "ModelName" the model name; "ModelObject" The winning model to later use; "EvaluationMetrics" Model metrics for models with ability to build.

**Author(s)**

Adrian Antico

**Examples**

```

|---------------------|--|
| AutoRecomDataCreate | <i>Convert transactional data.table to a binary ratings matrix</i> |
|---------------------|--|

---

## Description

Convert transactional data.table to a binary ratings matrix

## Usage

```

AutoRecomDataCreate(
  data,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  MetricColName = "TotalSales",
  ReturnMatrix = FALSE
)

```

**Arguments**

|                             |  |
|-----------------------------|--|
| <code>data</code>           | This is your transactional data.table. Must include an Entity (typically customer), ProductCode (such as SKU), and a sales metric (such as total sales). |
| <code>EntityColName</code>  | This is the column name in quotes that represents the column name for the Entity, such as customer   |
| <code>ProductColName</code> | This is the column name in quotes that represents the column name for the product, such as SKU   |
| <code>MetricColName</code>  | This is the column name in quotes that represents the column name for the metric, such as total sales  |
| <code>ReturnMatrix</code>   | Set to FALSE to coerce the object (desired route) or TRUE to return a matrix   |

**Value**

A BinaryRatingsMatrix

**Author(s)**

Adrian Antico and Douglas Pestana

**Examples**

```
## Not run:
RatingsMatrix <- AutoRecomDataCreate(
  data,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  MetricColName = "TotalSales",
  ReturnMatrix = TRUE)

## End(Not run)
```

---

|                 |   |
|-----------------|---|
| AutoRecommender | <i>Automatically build the best recommender model among models available.</i> |
|-----------------|---|

---

**Description**

This function returns the winning model that you pass onto AutoRecommenderScoring

**Usage**

```
AutoRecommender(
  data,
  Partition = "Split",
  KFold = 1,
  Ratio = 0.75,
  Given = 1,
```

```

    RatingType = "TopN",
    RatingsKeep = 20,
    SkipModels = "AssociationRules",
    ModelMetric = "TPR"
  )

```

### Arguments

|             |   |
|-------------|---|
| data        | This is your BinaryRatingsMatrix. See function RecomDataCreate  |
| Partition   | Choose from "split", "cross-validation", "bootstrap". See evaluationScheme in recommenderlab for details.   |
| KFolds      | Choose 1 for traditional train and test. Choose greater than 1 for the number of cross validations  |
| Ratio       | The ratio for train and test. E.g. 0.75 for 75 percent data allocated to training   |
| Given       | The number of products you would like to evaluate. Negative values implement all-but schemes.   |
| RatingType  | Choose from "TopN", "ratings", "ratingMatrix"   |
| RatingsKeep | The total ratings you wish to return. Default is 20.  |
| SkipModels  | AssociationRules runs the slowest and may crash your system. Choose from: "AssociationRules", "ItemBasedCF", "UserBasedCF", "PopularItems", "RandomItems" |
| ModelMetric | Choose from "Precision", "Recall", "TPR", or "FPR"  |

### Value

The winning model used for scoring in the AutoRecommenderScoring function

  Ratio = 0.75,
  Given = 1,
  RatingType = "TopN",
  RatingsKeep = 20,
  SkipModels = "AssociationRules",
  ModelMetric = "TPR")

## End(Not run)

```

---

`AutoRecommenderScoring`*The AutoRecomScoring function scores recommender models from AutoRecommender()*

---

## Description

This function will take your ratings matrix and model and score your data in parallel.

## Usage

```
AutoRecommenderScoring(  
  data,  
  WinningModel,  
  EntityColName = "CustomerID",  
  ProductColName = "StockCode",  
  NumItemsReturn = 1  
)
```

## Arguments

|                             |  |
|-----------------------------|--|
| <code>data</code>           | The binary ratings matrix from <code>RecomDataCreate()</code>  |
| <code>WinningModel</code>   | The winning model returned from <code>AutoRecommender()</code> |
| <code>EntityColName</code>  | Typically your customer ID                                     |
| <code>ProductColName</code> | Something like "StockCode"                                     |
| <code>NumItemsReturn</code> | Number of items to return on scoring                           |

## Value

Returns the prediction data

    ProductColName = "StockCode")

## End(Not run)

```

---

AutoTBATS

*AutoTBATS*

---

## Description

AutoTBATS is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The parameter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

## Usage

```

AutoTBATS(
  data,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxMovingAverages = 5L,
  MaxSeasonalPeriods = 1L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L
)

```

**Arguments**

|                     |   |
|---------------------|---|
| data                | Source data.table   |
| TargetVariableName  | Name of your time series target variable  |
| DateColumnName      | Name of your date column  |
| TimeAggLevel        | Choose from "year", "quarter", "month", "week", "day", "hour"   |
| EvaluationMetric    | Choose from MAE, MSE, and MAPE  |
| NumHoldOutPeriods   | Number of time periods to use in the out of sample testing  |
| NumFCPeriods        | Number of periods to forecast   |
| MaxLags             | A single value of the max number of lags to use in the internal auto.arima of tbats   |
| MaxMovingAverages   | A single value of the max number of moving averages to use in the internal auto.arima of tbats  |
| MaxSeasonalPeriods  | A single value for the max allowable seasonal periods to be tested in the tbats framework   |
| TrainWeighting      | Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent. |
| MaxConsecutiveFails | When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attempts without a new winner before terminating the procedure.    |
| MaxNumberModels     | Indicate the maximum number of models to test.  |
| MaxRunTimeMinutes   | Indicate the maximum number of minutes to wait for a result.  |

**AutoTransformationCreate**

*AutoTransformationCreate is a function for automatically identifying the optimal transformations for numeric features and transforming them once identified.*

---

## Description

AutoTransformationCreate is a function for automatically identifying the optimal transformations for numeric features and transforming them once identified. This function will loop through your selected transformation options (YeoJohnson, BoxCox, Asinh, Asin, and Logit) and find the one that produces data that is the closest to normally distributed data. It then makes the transformation and collects the metadata information for use in the AutoTransformationScore() function, either by returning the objects (always) or saving them to file (optional).

## Usage

```
AutoTransformationCreate(
  data,
  ColumnNames = NULL,
  Methods = c("BoxCox", "YeoJohnson", "Asinh", "Log", "LogPlus1", "Asin", "Logit",
    "Identity"),
  Path = NULL,
  TransID = "ModelID",
  SaveOutput = FALSE
)
```

## Arguments

|             |  |
|-------------|--|
| data        | This is your source data   |
| ColumnNames | List your columns names in a vector, for example, c("Target", "IV1")                             |
| Methods     | Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Asin", "Logit", and "Identity". |
| Path        | Set to the directly where you want to save all of your modeling files                            |
| TransID     | Set to a character value that corresponds with your modeling project                             |
| SaveOutput  | Set to TRUE to save necessary file to run AutoTransformationScore()                              |

## Value

data with transformed columns and the transformation object for back-transforming later

## Author(s)

Adrian Antico

## Examples

```
## Not run:
Correl <- 0.85
N <- 1000
data <- data.table::data.table(Adrian = runif(N))
```

```

data[, x1 := qnorm(Adrian)]
data[, x2 := runif(N)]
data[, Adrian1 := log(pnorm(Correl * x1 + sqrt(1-Correl^2) * qnorm(x2)))]
data <- RemixAutoML::AutoTransformationCreate(
  data,
  ColumnNames = "Sample",
  Methods = c("BoxCox",
              "YeoJohnson",
              "Asinh",
              "Log",
              "LogPlus1",
              "Asin",
              "Logit",
              "Identity"),
  Path = NULL,
  TransID = "Trans",
  SaveOutput = FALSE)

## End(Not run)

```

---

AutoTransformationScore

*AutoTransformationScore() is a the complimentary function to AutoTransformationCreate()*

---

## Description

AutoTransformationScore() is a the compliment function to AutoTransformationCreate(). Automatically apply or inverse the transformations you identified in AutoTransformationCreate() to other data sets. This is useful for applying transformations to your validation and test data sets for modeling. It's also useful for back-transforming your target and prediction columns after you have build and score your models so you can obtain statistics on the original features.

## Usage

```

AutoTransformationScore(
  ScoringData,
  FinalResults,
  Type = "Inverse",
  TransID = "TestModel",
  Path = NULL
)

```

## Arguments

|              |  |
|--------------|--|
| ScoringData  | This is your source data   |
| FinalResults | This is the FinalResults output object from AutoTransformationCreate().        |
| Type         | Set to "Inverse" to back-transfrom or "Apply" for applying the transformation. |
| TransID      | Set to a character value that corresponds with your modeling project           |
| Path         | Set to the directly where you want to save all of your modeling files          |

**Value**

data with transformed columns

**Author(s)**

Adrian Antico

Correl <- 0.85
N <- 1000
data <- data.table::data.table(Adrian = runif(N))
data[, x1 := qnorm(Adrian)]
data[, x2 := runif(N)]
data[, Adrian1 := log(pnorm(Correl * x1 + sqrt(1-Correl^2) * qnorm(x2)))]
data <- RemixAutoML::AutoTransformationScore(
  data,
  FinalResults,
  Path = NULL,
  TransID = "Trans")

## End(Not run)
```

---

AutoTS

---

*AutoTS is an automated time series modeling function*

---

**Description**

Step 1 is to build all the models and evaluate them on the number of HoldOutPeriods periods you specify. Step 2 is to pick the winner and rebuild the winning model on the full data set. Step 3 is to generate forecasts with the final model for FCPeriods that you specify. AutoTS builds the best time series models for each type, using optimized box-cox transformations and using a user-supplied frequency for the ts data conversion along with a model-based frequency for the ts data conversion, compares all types, selects the winner, and generates a forecast. Models include:

**Usage**

```
AutoTS(
  data,
  TargetName = "Target",
  DateName = "DateTime",
  FCPeriods = 30,
  HoldOutPeriods = 30,
```

```

    EvaluationMetric = "MAPE",
    InnerEval = "AICc",
    TimeUnit = "day",
    Lags = 25,
    SLags = 2,
    MaxFourierPairs = 0,
    NumCores = 4,
    SkipModels = NULL,
    StepWise = TRUE,
    TSClean = TRUE,
    ModelFreq = TRUE,
    PrintUpdates = FALSE,
    PlotPredictionIntervals = TRUE
)

```

### Arguments

|                                      |  |
|--------------------------------------|--|
| <code>data</code>                    | is the source time series data as a <code>data.table</code> - or a data structure that can be converted to a <code>data.table</code>                             |
| <code>TargetName</code>              | is the name of the target variable in your <code>data.table</code>   |
| <code>DateName</code>                | is the name of the date column in your <code>data.table</code>   |
| <code>FCPeriods</code>               | is the number of periods into the future you wish to forecast  |
| <code>HoldOutPeriods</code>          | is the number of periods to use for validation testing   |
| <code>EvaluationMetric</code>        | Set this to either "MAPE", "MSE", or "MAE". Default is "MAPE"  |
| <code>InnerEval</code>               | Choose from AICC, AIC, and BIC. These are what the time series models use internally to optimize   |
| <code>TimeUnit</code>                | is the level of aggregation your dataset comes in. Choices include: hour, day, week, month, quarter, year, 1Min, 5Min, 10Min, 15Min, and 30Min                   |
| <code>Lags</code>                    | is the number of lags you wish to test in various models (same as moving averages)   |
| <code>SLags</code>                   | is the number of seasonal lags you wish to test in various models (same as moving averages)  |
| <code>MaxFourierPairs</code>         | Set the max number of Fourier terms to test out. They will be utilized in the ARIMA and NN models.   |
| <code>NumCores</code>                | is the number of cores available on your computer  |
| <code>SkipModels</code>              | Don't run specified models - e.g. exclude all models "DSHW" "ARFIMA" "ARIMA" "ETS" "NNET" "TBATS" "TSLM"   |
| <code>StepWise</code>                | Set to TRUE to have ARIMA and ARFIMA run a stepwise selection process. Otherwise, all models will be generated in parallel execution, but still run much slower. |
| <code>TSClean</code>                 | Set to TRUE to have missing values interpolated and outliers replaced with interpolated values: creates separate models for a larger comparison set              |
| <code>ModelFreq</code>               | Set to TRUE to run a separate version of all models where the time series frequency is chosen algorithmically  |
| <code>PrintUpdates</code>            | Set to TRUE for a print to console of function progress  |
| <code>PlotPredictionIntervals</code> | Set to FALSE to not print prediction intervals on your plot output   |

## Details

DSHW: Double Seasonal Holt Winters

ARFIMA: Auto Regressive Fractional Integrated Moving Average

ARIMIA: Stepwise Auto Regressive Integrated Moving Average with specified max lags, seasonal lags, moving averages, and seasonal moving averages

ETS: Additive and Multiplicative Exponential Smoothing and Holt Winters

NNetar: Auto Regressive Neural Network models automatically compares models with 1 lag or 1 seasonal lag compared to models with up to N lags and N seasonal lags

TBATS: Exponential smoothing state space model with Box-Cox transformation, ARMA errors, Trend and Seasonal components

TSLM: Time Series Linear Model - builds a linear model with trend and season components extracted from the data

## Value

Returns a list containing 1: A data.table object with a date column and the forecasted values; 2: The model evaluation results; 3: The champion model for later use if desired; 4: The name of the champion model; 5: A time series ggplot with historical values and forecasted values with 80

---

AutoWord2VecModeler      *Automated word2vec data generation via H2O*

---

## Description

This function allows you to automatically build a word2vec model and merge the data onto your supplied dataset

## Usage

```

AutoWord2VecModeler(
  data,
  BuildType = "Combined",
  stringCol = c("Text_Col1", "Text_Col2"),
  KeepStringCol = FALSE,
  model_path = NULL,
  vects = 100,
  SaveStopWords = FALSE,
  MinWords = 1,
  WindowSize = 12,
  Epochs = 25,
  StopWords = NULL,
  SaveModel = "standard",
  Threads = max(1, parallel::detectCores() - 2),
  MaxMemory = "28G",
  SaveOutput = FALSE
)

```

## Arguments

|               |  |
|---------------|--|
| data          | Source data table to merge vects onto  |
| BuildType     | Choose from "individual" or "combined". Individual will build a model for every text column. Combined will build a single model for all columns. |
| stringCol     | A string name for the column to convert via word2vec   |
| KeepStringCol | Set to TRUE if you want to keep the original string column that you convert via word2vec   |
| model_path    | A string path to the location where you want the model and metadata stored   |
| vects         | The number of vectors to retain from the word2vec model  |

|               |   |
|---------------|---|
| SaveStopWords | Set to TRUE to save the stop words used   |
| MinWords      | For H2O word2vec model  |
| WindowSize    | For H2O word2vec model  |
| Epochs        | For H2O word2vec model  |
| StopWords     | For H2O word2vec model  |
| SaveModel     | Set to "standard" to save normally; set to "mojo" to save as mojo. NOTE: while you can save a mojo, I haven't figured out how to score it in the AutoH2OScoring function. |
| Threads       | Number of available threads you want to dedicate to model building  |
| MaxMemory     | Amount of memory you want to dedicate to model building   |
| SaveOutput    | Set to TRUE to save your models to file   |

## End(Not run)
```

**Description**

This function builds a word frequency table and a word cloud. It prepares data, cleans text, and generates output.

**Usage**

```
AutoWordFreq(
  data,
  TextColName = "DESCR",
  GroupColName = "ClusterAllNoTarget",
  GroupLevel = 0,
  RemoveEnglishStopwords = TRUE,
  Stemming = TRUE,
  StopWords = c("bla", "bla2")
)
```

**Arguments**

|                                     |  |
|-------------------------------------|--|
| <code>data</code>                   | Source data table  |
| <code>TextColName</code>            | A string name for the column   |
| <code>GroupColName</code>           | Set to NULL to ignore, otherwise set to Cluster column name (or factor column name)      |
| <code>GroupLevel</code>             | Must be set if <code>GroupColName</code> is defined. Set to cluster ID (or factor level) |
| <code>RemoveEnglishStopwords</code> | Set to TRUE to remove English stop words, FALSE to ignore                                |
| <code>Stemming</code>               | Set to TRUE to run stemming on your text data  |
| <code>StopWords</code>              | Add your own stopwords, in vector format   |

AutoXGBoostCARMA *AutoXGBoostCARMA Automated XGBoost Calendar, Holiday, ARMA, and Trend Variables Forecasting*

### Description

**AutoXGBoostCARMA** Automated XGBoost Calendar, Holiday, ARMA, and Trend Variables Forecasting. Create hundreds of thousands of time series forecasts using this function.

## Usage

```
AutoXGBoostCARMA(  
  data,  
  NonNegativePred = FALSE,  
  TrainOnFull = FALSE,  
  TargetColumnName = NULL,  
  DateColumnName = NULL,  
  HierarchGroups = NULL,  
  GroupVariables = NULL,  
  FC_Periods = 5,  
  TimeUnit = "week",  
  TimeGroups = c("weeks", "months"),  
  TargetTransformation = FALSE,  
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),  
  AnomalyDetection = NULL,  
  XREGS = NULL,  
  Lags = c(1:5),  
  MA_Periods = c(1:5),  
  SD_Periods = NULL,  
  Skew_Periods = NULL,  
  Kurt_Periods = NULL,
```

```

Quantile_Periods = NULL,
Quantiles_Selected = NULL,
Difference = TRUE,
FourierTerms = 6,
CalendarVariables = c("second", "minute", "hour", "wday", "mday", "yday", "week",
  "isoweek", "month", "quarter", "year"),
HolidayVariable = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
  "OtherEcclesticalFeasts"),
HolidayLags = 1L,
HolidayMovingAverages = 3L,
TimeTrendVariable = FALSE,
DataTruncate = FALSE,
ZeroPadSeries = NULL,
SplitRatios = c(1 - 10/100, 10/100),
TreeMethod = "hist",
NThreads = max(1, parallel::detectCores() - 2L),
EvalMetric = "MAE",

PartitionType = "timeseries",
Timer = TRUE,
DebugMode = FALSE
)

```

### Arguments

|                                   |   |
|-----------------------------------|---|
| <code>data</code>                 | Supply your full series data set here   |
| <code>NonNegativePred</code>      | TRUE or FALSE   |
| <code>TrainOnFull</code>          | Set to TRUE to train on full data   |
| <code>TargetColumnName</code>     | List the column name of your target variables column. E.g. "Target"   |
| <code>DateColumnName</code>       | List the column name of your date column. E.g. "DateTime"   |
| <code>HierarchGroups</code>       | = NULL Character vector or NULL with names of the columns that form the interaction hierarchy   |
| <code>GroupVariables</code>       | Defaults to NULL. Use NULL when you have a single series. Add in Group-Variables when you have a series for every level of a group or multiple groups.                                      |
| <code>FC_Periods</code>           | Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead  |
| <code>TimeUnit</code>             | List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year"  |
| <code>TimeGroups</code>           | Select time aggregations for adding various time aggregated GDL features.   |
| <code>TargetTransformation</code> | Run <code>AutoTransformationCreate()</code> to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables). |
| <code>Methods</code>              | Transformation options to test which include "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"  |

## AnomalyDetection

NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat\_high" = 4, tstat\_low = -4)

## XREGS

Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

## Lags

Select the periods for all lag variables you want to create. E.g. c(1:5,52)

## MA\_Periods

Select the periods for all moving average variables you want to create. E.g. c(1:5,52)

## SD\_Periods

Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)

## Skew\_Periods

Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)

## Kurt\_Periods

Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)

## Quantile\_Periods

Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)

## Quantiles\_Selected

Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95", "q99")

## Difference

Set to TRUE to put the I in ARIMA

## FourierTerms

Set to the max number of pairs

## CalendarVariables

NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

## HolidayVariable

NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

## HolidayLags

Number of lags for the holiday counts

## HolidayMovingAverages

Number of moving averages for holiday counts

## TimeTrendVariable

Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

## DataTruncate

Set to TRUE to remove records with missing values from the lags and moving average features created

## ZeroPadSeries

Set to "all", "inner", or NULL. See TimeSeriesFill for explanation

## SplitRatios

E.g c(0.7,0.2,0.1) for train, validation, and test sets

## TreeMethod

Choose from "hist", "gpu\_hist"

## NThreads

Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8

## EvalMetric

Select from "r2", "RMSE", "MSE", "MAE"

## GridTune

Set to TRUE to run a grid tune

## GridEvalMetric

This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'

|               |  |
|---------------|--|
| ModelCount    | Set the number of models to try in the grid tune   |
| NTrees        | Select the number of trees you want to have built to train the model                       |
| PartitionType | Select "random" for random data partitioning "time" for partitioning by time frames        |
| Timer         | Setting to TRUE prints out the forecast number while it is building                        |
| DebugMode     | Setting to TRUE generates printout of all header code comments during run time of function |

### Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoXGBoostClassifier *AutoXGBoostClassifier is an automated XGBoost modeling framework with grid-tuning and model evaluation*

---

## Description

AutoXGBoostClassifier is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to

create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

## Usage

```
AutoXGBoostClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  ReturnFactorLevels = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  Verbose = 0L,
  NumOfParDepPlots = 3L,
  NThreads = 8L,
  eval_metric = "auc",
  TreeMethod = "hist",
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  PassInGrid = NULL,
  Shuffles = 1L,
  Trees = 50L,
  eta = seq(0.05, 0.4, 0.05),
  max_depth = seq(4L, 16L, 2L),
  min_child_weight = seq(1, 10, 1),
  subsample = seq(0.55, 1, 0.05),
  colsample_bytree = seq(0.55, 1, 0.05)
)
```

## Arguments

|                             |  |
|-----------------------------|--|
| <code>data</code>           | This is your data set for training and testing your model  |
| <code>TrainOnFull</code>    | Set to TRUE to train on full data  |
| <code>ValidationData</code> | This is your holdout data set used in modeling either refine your hyperparameters.   |
| <code>TestData</code>       | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set. |

|                         |   |
|-------------------------|---|
| TargetColumnName        | Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0   1 numeric variable.  |
| FeatureColNames         | Either supply the feature column names OR the column number where the target is located (but not mixed types)   |
| IDcols                  | A vector of column names or column numbers to keep in your data but not include in the modeling.  |
| model_path              | A character string of your path file to where you want your output saved  |
| metadata_path           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.  |
| ModelID                 | A character string to name your model and output  |
| ReturnFactorLevels      | TRUE or FALSE. Set to FALSE to not return factor levels.  |
| ReturnModelObjects      | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)  |
| SaveModelObjects        | Set to TRUE to return all modeling objects to your environment  |
| Verbose                 | Set to 0 if you want to suppress model evaluation updates in training   |
| NumOfParDepPlots        | Tell the function the number of partial dependence calibration plots you want to create.  |
| NThreads                | Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8   |
| eval_metric             | This is the metric used to identify best grid tuned model. Choose from "logloss", "error", "aucpr", "auc"   |
| TreeMethod              | Choose from "hist", "gpu_hist"  |
| GridTune                | Set to TRUE to run a grid tuning procedure  |
| BaselineComparison      | Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.   |
| MaxModelsInGrid         | Number of models to test from grid options.   |
| MaxRunsWithoutNewWinner | A number  |
| MaxRunMinutes           | In minutes  |
| PassInGrid              | Default is NULL. Provide a data.table of grid options from a previous run.  |
| Shuffles                | Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning   |
| Trees                   | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L) |
| eta                     | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)       |

|                  |   |
|------------------|---|
| max_depth        | Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L) |
| min_child_weight | Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)            |
| subsample        | Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)                  |
| colsample_bytree | Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)           |

**Value**

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

```

### Arguments

|                  |   |
|------------------|---|
| TreeMethod       | Set to hist or gpu_hist depending on if you have an xgboost installation capable of gpu processing  |
| TrainOnFull      | Set to TRUE to train model on 100 percent of data   |
| PassInGrid       | Pass in a grid for changing up the parameter settings for catboost  |
| NThreads         | Set to the number of threads you would like to dedicate to training   |
| ModelID          | Define a character name for your models   |
| Paths            | The path to your folder where you want your model information saved   |
| MetaDataPaths    | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.   |
| data             | Source training data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| ValidationData   | Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| TestData         | Source test data. Do not include a column that has the class labels for the buckets as they are created internally.   |
| Buckets          | A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value. |
| TargetColumnName | Supply the column name or number for the target variable  |

|                         |  |
|-------------------------|--|
| FeatureColNames         | Supply the column names or number of the features (not included the Primary-DateColumn)                    |
| IDcols                  | Includes PrimaryDateColumn and any other columns you want returned in the validation data with predictions |
| TransformNumericColumns | Transform numeric column inside the AutoCatBoostRegression() function                                      |
| SplitRatios             | Supply vector of partition ratios. For example, c(0.70,0.20,0,10).   |
| SaveModelObjects        | Set to TRUE to save the model objects to file in the folders listed in Paths                               |
| ReturnModelObjects      | Set to TRUE to return all model objects  |
| NumOfParDepPlots        | Set to pull back N number of partial dependence calibration plots.   |
| GridTune                | Set to TRUE if you want to grid tune the models  |
| grid_eval_metric        | Select the metric to optimize in grid tuning. "accuracy", "microauc", "logloss"                            |
| MaxModelsInGrid         | Set to a numeric value for the number of models to try in grid tune  |
| BaselineComparison      | "default"  |
| MaxRunsWithoutNewWinner | Number of runs without a new winner before stopping the grid tuning  |
| MaxRunMinutes           | Max number of minutes to allow the grid tuning to run for  |
| Trees                   | Default 1000   |
| eta                     | Learning rates seq(0.05,0.40,0.05)   |
| max_depth               | Depth seq(4L, 16L, 2L)   |
| min_child_weight        | seq(1.0, 10.0, 1.0)  |
| subsample               | seq(0.55, 1.0, 0.05)   |
| colsample_bytree        | seq(0.55, 1.0, 0.05)   |

**Value**

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, Validation-Data.csv, EvaluationPlot.png, EvaluationBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoXGBoostMultiClass *AutoXGBoostMultiClass is an automated XGBoost modeling framework with grid-tuning and model evaluation*

---

## Description

AutoXGBoostMultiClass is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, variable importance, and column names used in model fitting.

## Usage

```
AutoXGBoostMultiClass(
    data,
    TrainOnFull = FALSE,
    ValidationData = NULL,
    TestData = NULL,
    TargetColumnName = NULL,
    FeatureColNames = NULL,
    IDcols = NULL,
    model_path = NULL,
    metadata_path = NULL,
    ModelID = "FirstModel",
    Objective = "multi:softmax",
    ReturnFactorLevels = TRUE,
    ReturnModelObjects = TRUE,
    SaveModelObjects = FALSE,
    Verbose = 0L,
    NumOfParDepPlots = 3L,
    NThreads = 8L,
    eval_metric = "merror",
    grid_eval_metric = "accuracy",
    TreeMethod = "hist",
    GridTune = FALSE,
    BaselineComparison = "default",
    MaxModelsInGrid = 10L,
    MaxRunsWithoutNewWinner = 20L,
    MaxRunMinutes = 24L * 60L,
    PassInGrid = NULL,
    Shuffles = 1L,
    Trees = 50L,
    eta = NULL,
    max_depth = NULL,
    min_child_weight = NULL,
    subsample = NULL,
    colsample_bytree = NULL
)
```

## Arguments

|                             |  |
|-----------------------------|--|
| <code>data</code>           | This is your data set for training and testing your model                          |
| <code>TrainOnFull</code>    | Set to TRUE to train on full data  |
| <code>ValidationData</code> | This is your holdout data set used in modeling either refine your hyperparameters. |

|                         |   |
|-------------------------|---|
| TestData                | This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.                          |
| TargetColumnName        | Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0   1 numeric variable.                        |
| FeatureColNames         | Either supply the feature column names OR the column number where the target is located (but not mixed types)   |
| IDcols                  | A vector of column names or column numbers to keep in your data but not include in the modeling.  |
| model_path              | A character string of your path file to where you want your output saved  |
| metadata_path           | A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.  |
| ModelID                 | A character string to name your model and output  |
| Objective               | 'multi:softmax'   |
| ReturnFactorLevels      | TRUE or FALSE. Set to FALSE to not return factor levels.  |
| ReturnModelObjects      | Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)  |
| SaveModelObjects        | Set to TRUE to return all modeling objects to your environment  |
| Verbose                 | Set to 0 if you want to suppress model evaluation updates in training   |
| NumOfParDepPlots        | Tell the function the number of partial dependence calibration plots you want to create.  |
| NThreads                | Set the maximum number of threads you'd like to dedicate to the model run.<br>E.g. 8  |
| eval_metric             | This is the metric used to identify best grid tuned model. Choose from "logloss", "error", "aucpr", "auc"   |
| grid_eval_metric        | "accuracy", "logloss", "microauc"   |
| TreeMethod              | Choose from "hist", "gpu_hist"  |
| GridTune                | Set to TRUE to run a grid tuning procedure  |
| BaselineComparison      | Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model. |
| MaxModelsInGrid         | Number of models to test from grid options.   |
| MaxRunsWithoutNewWinner | A number  |
| MaxRunMinutes           | In minutes  |
| PassInGrid              | Default is NULL. Provide a data.table of grid options from a previous run.  |
| Shuffles                | Numeric. List a number to let the program know how many times you want to shuffle the grids for grid tuning   |

|                  |   |
|------------------|---|
| Trees            | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L) |
| eta              | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)       |
| max_depth        | Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)   |
| min_child_weight | Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)  |
| subsample        | Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)  |
| colsample_bytree | Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)   |

AutoXGBoostScoring

*AutoXGBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions.*

---

## Description

AutoXGBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions. This function requires you to supply features for scoring. It will run `ModelDataPrep()` and the `DummifyDT()` function to prepare your features for xgboost data conversion and scoring.

## Usage

```

AutoXGBoostScoring(
  TargetType = NULL,
  ScoringData = NULL,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  FactorLevelsList = NULL,
  TargetLevels = NULL,
  Objective = "multi:softmax",
  OneHot = FALSE,
  ModelObject = NULL,
  ModelPath = NULL,
  ModelID = NULL,

```

```

ReturnFeatures = TRUE,
TransformNumeric = FALSE,
BackTransNumeric = FALSE,
TargetColumnName = NULL,
TransformationObject = NULL,
TransID = NULL,
TransPath = NULL,
MDP_Impute = TRUE,
MDP_CharToFactor = TRUE,
MDP_RemoveDates = TRUE,
MDP_MissFactor = "0",
MDP_MissNum = -1
)

```

### Arguments

|                      |  |
|----------------------|--|
| TargetType           | Set this value to "regression", "classification", or "multiclass" to score models built using AutoCatBoostRegression(), AutoCatBoostClassify() or AutoCatBoostMultiClass().  |
| ScoringData          | This is your data.table of features for scoring. Can be a single row or batch.   |
| FeatureColumnNames   | Supply either column names or column numbers used in the AutoXGBoost__() function  |
| IDcols               | Supply ID column numbers for any metadata you want returned with your predicted values   |
| FactorLevelsList     | Supply the factor variables' list from DummifyDT()   |
| TargetLevels         | Supply the target levels output from AutoXGBoostMultiClass() or the scoring function will go looking for it in the file path you supply.   |
| Objective            | Set to 'multi:softprobs' if you did so in training. Default is softmax   |
| OneHot               | Set to TRUE to have one-hot-encoding run. Otherwise, N columns will be made for N levels of a factor variable  |
| ModelObject          | Supply a model for scoring, otherwise it will have to search for it in the file path you specify   |
| ModelPath            | Supply your path file used in the AutoXGBoost__() function   |
| ModelID              | Supply the model ID used in the AutoXGBoost__() function   |
| ReturnFeatures       | Set to TRUE to return your features with the predicted values.   |
| TransformNumeric     | Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.  |
| BackTransNumeric     | Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.  |
| TargetColumnName     | Input your target column name used in training if you are utilizing the transformation service   |
| TransformationObject | Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file. |

|                  |  |
|------------------|--|
| TransID          | Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().                   |
| TransPath        | Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath. |
| MDP_Impute       | Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function  |
| MDP_CharToFactor | Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function  |
| MDP_RemoveDates  | Set to TRUE if you have date of timestamp columns in your ScoringData  |
| MDP_MissFactor   | If you set MDP_Impute to TRUE, supply the character values to replace missing values with  |
| MDP_MissNum      | If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with   |

**Value**

A data.table of predicted values with the option to return model features as well.

|------------|--|
| ChartTheme | <i>ChartTheme function is a ggplot theme generator for ggplots</i> |
|------------|--|

---

Description

This function helps your ggplots look professional with the choice of the two main colors that will dominate the theme

**Usage**

```
ChartTheme(
  Size = 12,
  AngleX = 35,
  AngleY = 0,
  ChartColor = "lightsteelblue1",
  BorderColor = "darkblue",
  TextColor = "darkblue",
  GridColor = "white",
  BackGroundColor = "gray95",
  LegendPosition = "bottom"
)
```

**Arguments**

|                 |                                       |
|-----------------|---------------------------------------|
| Size            | The size of the axis labels and title |
| AngleX          | The angle of the x axis labels        |
| AngleY          | The angle of the Y axis labels        |
| ChartColor      | "lightsteelblue1",                    |
| BorderColor     | "darkblue",                           |
| TextColor       | "darkblue",                           |
| GridColor       | "white",                              |
| BackGroundColor | "gray95",                             |
| LegendPosition  | Where to place legend                 |

**Value**

An object to pass along to ggplot objects following the "+" sign

ClassificationMetrics *ClassificationMetrics*

---

## Description

ClassificationMetrics

## Usage

```

ClassificationMetrics(
  TestData,
  Thresholds,
  Target,
  Predict,
  PositiveOutcome,
  NegativeOutcome,
  CostMatrix = c(1, 0, 0, 1)
)

```

## Arguments

|                 |   |
|-----------------|---|
| TestData        | Test data from your modeling  |
| Thresholds      | Value   |
| Target          | Name of your target variable  |
| Predict         | Name of your predicted value variable   |
| PositiveOutcome | The value of the positive outcome level   |
| NegativeOutcome | The value of the negative outcome level   |
| CostMatrix      | c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost) |

## Arguments

|                                    |   |
|------------------------------------|---|
| <code>data</code>                  | data object   |
| <code>PartitionRatios</code>       | Requires three values for train, validation, and test data sets   |
| <code>BaseFunnelMeasure</code>     | E.g. "Leads". This value should be a forward looking variable. Say you want to forecast <code>ConversionMeasure</code> 2 months into the future. You should have two months into the future of values of <code>BaseFunnelMeasure</code> |
| <code>ConversionMeasure</code>     | E.g. "Conversions". Rate is derived as conversions over leads by cohort periods out   |
| <code>ConversionRateMeasure</code> | Conversions over Leads for every cohort   |
| <code>CohortPeriodsVariable</code> | Numeric. Numerical value of the the number of periods since cohort base date.   |
| <code>CalendarDate</code>          | The name of your date column that represents the calendar date  |
| <code>CohortDate</code>            | The name of your date column that represents the cohort date  |
| <code>TruncateDate</code>          | NULL. Supply a date to represent the earliest point in time you want in your data. Filtering takes place before partitioning data so feature engineering can include as many non null values as possible.                               |
| <code>TimeUnit</code>              | Base time unit of data. "days", "weeks", "months", "quarters", "years"  |

|                               |  |
|-------------------------------|--|
| CalendarTimeGroups            | TimeUnit value must be included. If you want to generate lags and moving averages in several time based aggregations, choose from "days", "weeks", "months", "quarters", "years".  |
| CohortTimeGroups              | TimeUnit value must be included. If you want to generate lags and moving averages in several time based aggregations, choose from "days", "weeks", "months", "quarters", "years".  |
| TransformTargetVariable       | TRUE or FALSE  |
| TransformMethods              | Choose from "Identity", "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"  |
| AnomalyDetection              | Provide a named list. See examples   |
| Jobs                          | Default is "eval" and "train"  |
| SaveModelObjects              | Set to TRUE to return all modeling objects to your environment   |
| ModelID                       | A character string to name your model and output   |
| ModelPath                     | Path to where you want your models saved   |
| MetaDataPath                  | Path to where you want your metadata saved. If NULL, function will try ModelPath if it is not NULL.  |
| TaskType                      | "GPU" or "CPU" for catboost training   |
| NumGPUs                       | Number of GPU's you would like to utilize  |
| DT_Threads                    | Number of threads to use for data.table. Default is Total - 2  |
| EvaluationMetric              | This is the metric used inside catboost to measure performance on validation data during a grid-tune. "RMSE" is the default, but other options include: "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError". |
| LossFunction                  | Used in model training for model fitting. Select from 'RMSE', 'MAE', 'Quantile', 'LogLinQuantile', 'MAPE', 'Poisson', 'PairLogitPairwise', 'Tweedie', 'QueryRMSE'  |
| NumOfParDepPlots              | Number of partial dependence plots to return   |
| MetricPeriods                 | Number of trees to build before the internal catboost eval step happens  |
| CalendarVariables             | "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"  |
| HolidayGroups                 | c("USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts")   |
| ImputeRollStats               | Constant value to fill NA after running AutoLagRollStats()   |
| CohortHolidayLags             | c(1L, 2L, 7L),   |
| CohortHolidayMovingAverages   | c(3L, 7L),   |
| CalendarHolidayLags           | c(1L, 2L, 7L),   |
| CalendarHolidayMovingAverages | = c(3L, 7L),   |

|                            |   |
|----------------------------|---|
| CalendarLags               | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CalendarMovingAverages     | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CalendarStandardDeviations | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CalendarSkews              | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CalendarKurts              | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CalendarQuantiles          | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CalendarQuantilesSelected  | Supply a vector of "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"   |
| CohortLags                 | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CohortMovingAverages       | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CohortStandardDeviations   | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CohortSkews                | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CohortKurts                | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CohortQuantiles            | List of the form <code>list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))</code>   |
| CohortQuantilesSelected    | Supply a vector of "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"   |
| PassInGrid                 | Defaults to NULL. Pass in a single row of grid from a previous output as a <code>data.table</code> (they are collected as <code>data.tables</code> )  |
| GridTune                   | Set to TRUE to run a grid tuning procedure. Set a number in <code>MaxModelsInGrid</code> to tell the procedure how many models you want to test.  |
| BaselineComparison         | Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model. |
| MaxModelsInGrid            | Number of models to test from grid options  |
| MaxRunMinutes              | Maximum number of minutes to let this run   |
| MaxRunsWithoutNewWinner    | Number of models built before calling it quits  |

|               |   |
|---------------|---|
| Trees         | Bandit grid partitioned. The maximum number of trees you want in your models  |
| Depth         | Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)   |
| LearningRate  | Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)                     |
| L2_Leaf_Reg   | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)                                  |
| RSM           | CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)                     |
| BootStrapType | Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No") |
| GrowPolicy    | Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Loss-guide")                         |

### Value

Saves metadata and models to files of your choice. Also returns metadata and models from the function. User specifies both options.

|                       |  |
|-----------------------|--|
| RestrictDateRange     | Set to TRUE to only pull samples by entity within the entity life (not beyond)   |
| Case                  | Currently set as 1 for forecasting and 2 for other   |
| FC_Periods            | The number of future periods to collect data on  |
| SaveData              | Set to TRUE to save the MetaData and final modeling data sets to file  |
| FilePath              | Set to your file of choice for where you want the data sets saved  |
| TargetVariableName    | The name of your target variable that represents demand  |
| DateVariableName      | The date variable of the demand instances  |
| GDL_Targets           | The variable names to run through AutoLagRollStats()   |
| TimeUnit              | List the time unit your data is aggregated by. E.g. "day", "week", "month", "quarter", "year"  |
| TimeGroups            | = c("raw", "day", "week"),   |
| GroupingVariables     | These variables (or single variable) is the combination of categorical variables that uniquely defines the level of granularity of each individual level to forecast. E.g. "sku" or c("Store", "Department"). Sku is typically unique for all sku's. Store and Department in combination defines all unique departments as the department may be repeated across the stores. |
| HierarchyGroupVars    | Group vars   |
| MinTimeWindow         | The number of time periods you would like to omit for training. Default is 1 so that at a minimum, there is at least one period of values to forecast. You can set it up to a larger value if you do not want more possible target windows for the lower target window values.   |
| MinTxnRecords         | I typically set this to 2 so that there is at least one other instance of demand so that the forecasted values are not complete nonsense.  |
| Lags                  | Select the periods for all lag variables you want to create. E.g. c(1:5,52)  |
| MA_Periods            | Select the periods for all moving average variables you want to create. E.g. c(1:5,52)   |
| SD_Periods            | Select the periods for all sd variables you want to create. E.g. c(1:5,52)   |
| Skew_Periods          | Select the periods for all skew variables you want to create. E.g. c(1:5,52)   |
| Kurt_Periods          | Select the periods for all kurtosis variables you want to create. E.g. c(1:5,52)   |
| Quantile_Periods      | Select the periods for all quantiles variables you want to create. E.g. c(1:5,52)  |
| Quantiles_Selected    | Select the quantiles you want. q5, q10, ..., q95   |
| HolidayLags           | Select the lags you want generated   |
| HolidayMovingAverages | Select the moving averages you want generated  |
| TimeBetween           | Supply a name or NULL  |
| TimeTrendVariable     | Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.   |

**CalendarVariables**

Set to TRUE to have calendar variables created. The calendar variables are numeric representations of second, minute, hour, week day, month day, year day, week, isoweek, quarter, and year

**HolidayGroups** Input the holiday groups of your choice from the CreateHolidayVariable() function in this package

**PowerRate** Sampling parameter

**SampleRate** Set this to a value greater than 0. The calculation used is the number of records per group level raised to the power of PowerRate. Then that values is multiplied by SampleRate.

**TargetWindowSamples**  
= 5

**PrintSteps** Set to TRUE to have operation steps printed to the console

**Value**

Returns two data.table data sets: The first is a modeling data set for the count distribution while the second data set if for the size model data set.

## CreateCalendarVariables

*CreateCalendarVariables Create Calendar Variables*

---

### Description

CreateCalendarVariables Rapidly creates calendar variables based on the date column you provide

### Usage

```

CreateCalendarVariables(
  data,
  DateCols = NULL,
  AsFactor = FALSE,
  TimeUnits = "wday"
)

```

### Arguments

|           |   |
|-----------|---|
| data      | This is your data   |
| DateCols  | Supply either column names or column numbers of your date columns you want to use for creating calendar variables   |
| AsFactor  | Set to TRUE if you want factor type columns returned; otherwise integer type columns will be returned   |
| TimeUnits | Supply a character vector of time units for creating calendar variables. Options include: "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year" |

**Value**

Returns your data.table with the added calendar variables at the end

**Author(s)**

Adrian Antico

CreateHolidayVariables

CreateHolidayVariables Create Holiday Count Columns

---

**Description**

CreateHolidayVariables Rapidly creates holiday count variables based on the date columns you provide

**Usage**

```
CreateHolidayVariables(
  data,
  DateCols = NULL,
  HolidayGroups = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
    "OtherEcclesticalFeasts"),
  Holidays = NULL,
  GroupingVars = NULL,
  Print = FALSE
)
```

**Arguments**

|               |   |
|---------------|---|
| data          | This is your data   |
| DateCols      | Supply either column names or column numbers of your date columns you want to use for creating calendar variables |
| HolidayGroups | Pick groups   |
| Holidays      | Pick holidays   |
| GroupingVars  | Grouping variable names   |
| Print         | Set to TRUE to print iteration number to console  |

**Value**

Returns your data.table with the added holiday indicator variable

DownloadCSVFromStorageExplorer

*DownloadCSVFromStorageExplorer*

---

**Description**

DownloadCSVFromStorageExplorer

**Usage**

```
DownloadCSVFromStorageExplorer(
  UploadCSVObjectName = "data.csv",
  SaveCSVFilePath = file.path(Root),
  SaveCSVName = "RawData.csv",
  UploadLocation = "Analytics Sandbox/Machine Learning",
  DataStoreName = NULL
)
```

**Arguments**

|                     |   |
|---------------------|---|
| UploadCSVObjectName | Name of the file you uploaded to the Microsoft Azure Storage Explorer |
| SaveCSVFilePath     | Path file to where you want to save your csv in Azure                 |
| SaveCSVName         | The name you want to give the csv that will be saved                  |
| UploadLocation      | The location to where the data is saved in the Azure Storage Explorer |
| DataStoreName       | The name of the store in data factory where you uploaded your data    |

DT\_BinaryConfusionMatrix  
*DT\_BinaryConfusionMatrix*

---

**Description**

DT\_BinaryConfusionMatrix is for computing all metrics related to binary modeling outcomes

**Usage**

```
DT_BinaryConfusionMatrix(
  data = MetricsData,
  GroupVariables = "IntervalNum",
  Target = "ActiveAtInterval",
  Predicted = "p1"
)
```

**Arguments**

|                |  |
|----------------|--|
| data           | Supply your model validation data with predictions         |
| GroupVariables | Supply grouping variables to generate statistics by groups |
| Target         | The name of your target variable column                    |
| Predicted      | The name of your predicted value column#'                  |

  Predicted = "p1")

## End(Not run)
```

---

DT\_GDL\_Feature\_Engineering

*An Automated Feature Engineering Function Using data.table frol-  
lmean*

---

## Description

Builds autoregressive and moving average from target columns and distributed lags and distributed moving average for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and moving averages. This function works for data with groups and without groups.

## Usage

```
DT_GDL_Feature_Engineering(
  data,
  lags = c(seq(1, 50, 1)),
  periods = c(seq(5, 95, 5)),
  SDperiods = c(seq(5, 95, 5)),
  Skewperiods = c(seq(5, 95, 5)),
  Kurtperiods = c(seq(5, 95, 5)),
  Quantileperiods = c(seq(5, 95, 5)),
  statsFUNs = c("mean"),
  targets = NULL,
  groupingVars = NULL,
  sortDateName = NULL,
  timeDiffTarget = NULL,
  timeAgg = c("days"),
  WindowingLag = 0,
  Type = c("Lag"),
  SimpleImpute = TRUE
)
```

## Arguments

|         |   |
|---------|---|
| data    | A data.table you want to run the function on  |
| lags    | A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1. |
| periods | A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations. |

|                 |   |
|-----------------|---|
| SDperiods       | A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.   |
| Skewperiods     | A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.   |
| Kurtperiods     | A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.   |
| Quantileperiods | A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.   |
| statsFUNs       | Select from the following <code>c("mean", "sd", "skew", "kurt", "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95", "q99")</code> |
| targets         | A character vector of the column names for the reference column in which you will build your lags and rolling stats   |
| groupingVars    | A character vector of categorical variable names you will build your lags and rolling stats by  |
| sortDateName    | The column name of your date column used to sort events over time   |
| timeDiffTarget  | Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.  |
| timeAgg         | List the time aggregation level for the time between events features, such as "hour", "day", "week", "month", "quarter", or "year"  |
| WindowingLag    | Set to 0 to build rolling stats off of target columns directly or set to 1 to build the rolling stats off of the lag-1 target   |
| Type            | List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values   |
| SimpleImpute    | Set to TRUE for factor level imputation of "0" and numeric imputation of -1   |

**Value**

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

**Author(s)**

Adrian Antico

**See Also**

**Examples**

```
## Not run:
N = 25116
data <- data.table::data.table(
  DateTime = as.Date(Sys.time()),
  Target = stats::filter(rnorm(N, mean = 50, sd = 20),
    filter=rep(1,10),
```

```

    circular=TRUE))
data[, temp := seq(1:N)][, DateTime := DateTime - temp][
  , temp := NULL]
data <- data[order(DateTime)]
data <- DT_GDL_Feature_Engineering(
  data,
  lags          = c(seq(1,5,1)),
  periods       = c(3,5,10,15,20,25),
  SDperiods     = c(seq(5, 95, 5)),
  Skewperiods   = c(seq(5, 95, 5)),
  Kurtperiods   = c(seq(5, 95, 5)),
  Quantileperiods = c(seq(5, 95, 5)),
  statsFUNs     = c("mean",
    "sd", "skew", "kurt", "q05", "q95"),
  targets       = c("Target"),
  groupingVars  = NULL,
  sortDateName  = "DateTime",
  timeDiffTarget = c("Time_Gap"),
  timeAgg       = c("days"),
  WindowingLag  = 1,
  Type          = "Lag",
  SimpleImpute  = TRUE)

## End(Not run)

```

DummifyDT

*DummifyDT creates dummy variables for the selected columns.*

## Description

DummifyDT creates dummy variables for the selected columns. Either one-hot encoding, N+1 columns for N levels, or N columns for N levels.

## Usage

```

DummifyDT(
  data,
  cols,
  KeepFactorCols = FALSE,
  OneHot = FALSE,
  SaveFactorLevels = FALSE,
  SavePath = NULL,
  ImportFactorLevels = FALSE,
  FactorLevelsList = NULL,
  ClustScore = FALSE,
  ReturnFactorLevels = FALSE
)

```

## Arguments

|                |  |
|----------------|--|
| data           | The data set to run the micro auc on   |
| cols           | A vector with the names of the columns you wish to dichotomize               |
| KeepFactorCols | Set to TRUE to keep the original columns used in the dichotomization process |

|                    |   |
|--------------------|---|
| OneHot             | Set to TRUE to run one hot encoding, FALSE to generate N columns for N levels   |
| SaveFactorLevels   | Set to TRUE to save unique levels of each factor column to file as a csv  |
| SavePath           | Provide a file path to save your factor levels. Use this for models that you have to create dummy variables for.  |
| ImportFactorLevels | Instead of using the data you provide, import the factor levels csv to ensure you build out all of the columns you trained with in modeling.  |
| FactorLevelsList   | Supply a list of factor variable levels   |
| ClustScore         | This is for scoring AutoKMeans. Set to FALSE for all other applications.  |
| ReturnFactorLevels | If you want a named list of all the factor levels returned, set this to TRUE. Doing so will cause the function to return a list with the source data.table and the list of factor variables' levels |

**Value**

Either a data table with new dummy variables columns and optionally removes base columns (if ReturnFactorLevels is FALSE), otherwise a list with the data.table and a list of the factor levels.

**Author(s)**

Adrian Antico

---

EvalPlot

*EvalPlot automatically builds calibration plots for model evaluation*

---

## Description

This function automatically builds calibration plots and calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

## Usage

```

EvalPlot(
  data,
  PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"),
  GraphType = c("calibration"),
  PercentileBucket = 0.05,
  aggrfun = function(x) mean(x, na.rm = TRUE)
)

```

## Arguments

|                                |  |
|--------------------------------|--|
| <code>data</code>              | Data containing predicted values and actual values for comparison  |
| <code>PredictionColName</code> | String representation of column name with predicted values from model                                    |
| <code>TargetColName</code>     | String representation of column name with target values from model                                       |
| <code>GraphType</code>         | Calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation |
| <code>PercentileBucket</code>  | Number of buckets to partition the space on (0,1) for evaluation   |
| <code>aggrfun</code>           | The statistics function used in aggregation, listed as a function  |

## Value

Calibration plot or boxplot

FakeDataGenerator

*FakeDataGenerator*

---

**Description**

FakeDataGenerator

**Usage**

```
FakeDataGenerator(
  Correlation = 0.7,
  N = 1000L,
  ID = 5L,
  FactorCount = 2L,
  AddDate = TRUE,
  ZIP = 5L,
  TimeSeries = FALSE,
  TimeSeriesTimeAgg = "day",
  ChainLadderData = FALSE,
  Classification = FALSE,
  MultiClass = FALSE
)
```

**Arguments**

|                   |  |
|-------------------|--|
| Correlation       | Set the correlation value for simulated data   |
| N                 | Number of records  |
| ID                | Number of IDcols to include  |
| FactorCount       | Number of factor type columns to create  |
| AddDate           | Set to TRUE to include a date column   |
| ZIP               | Zero Inflation Model target variable creation. Select from 0 to 5 to create that number of distinctly distributed data, stratified from small to large |
| TimeSeries        | For testing AutoBanditSarima   |
| TimeSeriesTimeAgg | Choose from "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year",  |
| ChainLadderData   | Set to TRUE to return Chain Ladder Data for using AutoMLChainLadderTrainer   |
| Classification    | Set to TRUE to build classification data   |
| MultiClass        | Set to TRUE to build MultiClass data   |

GenTSAnomVars

*GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure*

---

**Description**

GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure. Data is z-scaled and grouped by factors and time periods to determine which points are above and below the control limits in a cumulative time fashion. Then a cumulative rate is created as the final variable. Set KeepAllCols to FALSE to utilize the intermediate features to create rolling stats from them. The anomalies are separated into those that are extreme on the positive end versus those that are on the negative end.

**Usage**

```
GenTSAnomVars(
  data,
  ValueCol = "Value",
  GroupVars = NULL,
  DateVar = "DATE",
  HighThreshold = 1.96,
  LowThreshold = -1.96,
  KeepAllCols = TRUE,
  IsDataScaled = FALSE
)
```

**Arguments**

|               |  |
|---------------|--|
| data          | the source residuals data.table                  |
| ValueCol      | the numeric column to run anomaly detection over |
| GroupVars     | this is a group by variable                      |
| DateVar       | this is a time variable for grouping             |
| HighThreshold | this is the threshold on the high end            |
| LowThreshold  | this is the threshold on the low end             |
| KeepAllCols   | set to TRUE to remove the intermediate features  |
| IsDataScaled  | set to TRUE if you already scaled your data      |

**Value**

The original data.table with the added columns merged in. When KeepAllCols is set to FALSE, you will get back two columns: AnomHighRate and AnomLowRate - these are the cumulative anomaly rates over time for when you get anomalies from above the thresholds (e.g. 1.96) and below the thresholds.

H2oAutoencoder

*H2oAutoencoder for anomaly detection and dimensionality reduction***Description**

H2oAutoencoder for anomaly detection and or dimensionality reduction

**Usage**

```
H2oAutoencoder(
  AnomalyDetection = TRUE,
  DimensionReduction = TRUE,
  data,
  ValidationData = NULL,
  Features = NULL,
  RemoveFeatures = FALSE,
  NThreads = max(1L, parallel::detectCores() - 2L),
```

```

MaxMem = "28G",
H2oShutdown = TRUE,
ModelID = "TestModel",
LayerStructure = NULL,
ReturnLayer = 4L,
per_feature = TRUE,
Activation = "Tanh",
Epochs = 5L,
L2 = 0.1,
ElasticAveraging = TRUE,
ElasticAveragingMovingRate = 0.9,
ElasticAveragingRegularization = 0.001
)

```

### Arguments

|                                |  |
|--------------------------------|--|
| AnomalyDetection               | Set to TRUE to run anomaly detection   |
| DimensionReduction             | Set to TRUE to run dimension reduction   |
| data                           | The data.table with the columns you wish to have analyzed  |
| ValidationData                 | The data.table with the columns you wish to have scored  |
| Features                       | NULL Column numbers or column names  |
| RemoveFeatures                 | Set to TRUE if you want the features you specify in the Features argument to be removed from the data returned |
| NThreads                       | max(1L, parallel::detectCores()-2L)  |
| MaxMem                         | "28G"  |
| H2oShutdown                    | Setting to TRUE will shutdown H2O when it done being used internally.  |
| ModelID                        | "TestModel"  |
| LayerStructure                 | a  |
| ReturnLayer                    | Which layer of the NNet to return. Choose from 1-7 with 4 being the layer with the least amount of nodes       |
| per_feature                    | Set to TRUE to have per feature anomaly detection generated. Otherwise and overall value will be generated     |
| Activation                     | Choose from "Tanh", "TanhWithDropout", "Rectifier", "RectifierWithDropout", "Maxout", "MaxoutWithDropout"      |
| Epochs                         | Quantile value to find the cutoff value for classifying outliers   |
| L2                             | Specify the amount of memory to allocate to H2O. E.g. "28G"  |
| ElasticAveraging               | Specify the number of threads (E.g. cores * 2)   |
| ElasticAveragingMovingRate     | Specify the number of decision trees to build  |
| ElasticAveragingRegularization | Specify the row sample rate per tree   |

### Value

A data.table

```

---

ID\_BuildTrainDataSets *ID\_BuildTrainDataSets for assembling data*

---

## Description

ID\_BuildTrainDataSets for assembling data for the IntermittentDemandBootStrapper() function.

## Usage

```
ID_BuildTrainDataSets(
  MetaData,
  data,
  Case = 2L,
  TargetVariableName = NULL,
  DateVariableName = NULL,
  GroupingVariables = NULL,
  FC_Periods,
  TimeUnit = "week",
  PowerRate = 0.5,
  SampleRate = 5L,
  TargetWindowSamples = 5L
)
```

## Arguments

|                    |  |
|--------------------|--|
| MetaData           | This is the metadata returned from the ID_MetadataGenerator() function |
| data               | This is your transactional data  |
| Case               | Indicate which data constructor method to use                          |
| TargetVariableName | Your target variable names   |
| DateVariableName   | Your date variable names   |
| GroupingVariables  | Your grouping variables  |
| FC_Periods         | The number of periods to forecast                                      |
| TimeUnit           | The time period unit, such as "day", "week", or "month"                |

|                     |   |
|---------------------|---|
| PowerRate           | The calculated for determining the total samples is number of records to the power of PowerRate. Then that values is multiplied by the SampleRate. This ensures that a more representative sample is generated across the data set. |
| SampleRate          | The value used to sample from each level of the grouping variables  |
| TargetWindowSamples | The number of different targets to utilize for a single random start date   |

**Value**

Returns the count modeling data and the size modeling data

**See Also**

---

ID\_MetadataGenerator     *ID\_MetadataGenerator for summary metadata for transactional data*

---

**Description**

ID\_MetadataGenerator for summary metadata for transactional data. The data returned from this function feeds into the IntermittentDemandBootStrapper() function.

**Usage**

```
ID_MetadataGenerator(
  data,
  RestrictDateRange = TRUE,
  DateVariableName = NULL,
  GroupingVariables = NULL,
  MinTimeWindow = 1L,
  MinTxnRecords = 2L,
  DateInterval = "day"
)
```

**Arguments**

|                   |  |
|-------------------|--|
| data              | This is your transactional level data  |
| RestrictDateRange |  |
|                   | = TRUE   |
| DateVariableName  |  |
|                   | Bla  |
| GroupingVariables |  |
|                   | Bla  |
| MinTimeWindow     | The number of time periods you would like to omit for training. Default is 1 so that at a minimum, there is at least one period of values to forecast. You can set it up to a larger value if you do not want more possible target windows for the lower target window values. |
| MinTxnRecords     | I typically set this to 2 so that there is at least one other instance of demand so that the forecasted values are not complete nonsense.  |
| DateInterval      | This is the time unit for determining date calculations  |

**Value**

Returns a data.table with summary information for the IntermittentDemandBootStrapper() function.

**See Also**

  TimeUnit = TimeUnit
)

## End(Not run)
```

---

ID\_TrainingDataGenerator

*ID\_TrainingDataGenerator for subsetting data*

---

**Description**

ID\_TrainingDataGenerator for subsetting data for the IntermittentDemandBootStrapper() function.

**Usage**

```
ID_TrainingDataGenerator(
  data,
  Type = "timetoevent1",
  TargetVariableName = NULL,
  Level = NULL,
  DateVariableName = NULL,
  GroupingVariables = NULL,
  RandomStartDate = NULL,
  TimeUnit = NULL,
  TargetWindow = NULL
)
```

**Arguments**

|      |                                  |
|------|----------------------------------|
| data | Source data                      |
| Type | "timetoevent1", "eventinwindow1" |

|                    |  |
|--------------------|--|
| TargetVariableName | Name of the variables to run feature engineering on. List the actual target variable name first. |
| Level              | The individual level of your group variable  |
| DateVariableName   | Name of your date variable   |
| GroupingVariables  | Your grouping variables  |
| RandomStartDate    | The date to partition the data   |
| TimeUnit           | This is the TimeUnit you selected for aggregation  |
| TargetWindow       | The length of the target window sampled  |

**Value**

Returns two data sets for the IntermittentDemandBootStrapper() function based on a single level from the grouping variables.

---

ID\_TrainingDataGenerator2

*ID\_TrainingDataGenerator2 for subsetting data*

---

**Description**

ID\_TrainingDataGenerator2 for subsetting data for the IntermittentDemandBootStrapper() function.

**Usage**

```
ID_TrainingDataGenerator2(
  data,
  TargetVariableName = NULL,
  Level = NULL,
  GroupingVariables = NULL,
  DateVariableName = NULL,
  RandomStartDate = NULL,
  TimeUnit = NULL,
  TargetWindow = NULL
)
```

**Arguments**

|                    |   |
|--------------------|---|
| data               | Source data                                       |
| TargetVariableName | vector of variable names                          |
| Level              | The individual level of your group variable       |
| GroupingVariables  | Your grouping variables                           |
| DateVariableName   | Name of your date variable                        |
| RandomStartDate    | The date to partition the data                    |
| TimeUnit           | This is the TimeUnit you selected for aggregation |
| TargetWindow       | The length of the target window sampled           |

**Value**

Returns two data sets for the `IntermittentDemandBootStrapper()` function based on a single level from the grouping variables.

IntermittentDemandScoringDataGenerator

*IntermittentDemandScoringDataGenerator*

---

**Description**

`IntermittentDemandScoringDataGenerator` creates the scoring data for forecasting. It will recreate the same features used for modeling, take the most recent record, and then duplicate those records for each forecast period specified.

**Usage**

```
IntermittentDemandScoringDataGenerator(
  data = NULL,
  FC_Periods = 52,
  SaveData = FALSE,
  FilePath = NULL,
  TargetVariableName = "qty",
  DateVariableName = "date",
  GroupingVariables = "sku",
  Lags = 1:7,
  MovingAverages = seq(7, 28, 7),
  TimeTrendVariable = TRUE,
  TimeUnit = "day",
  CurrentDate = NULL,
```

```

    CalendarVariables = c("wday", "mday", "yday", "week", "isoweek", "month", "quarter",
                          "year"),
    HolidayGroups = "USPublicHolidays"
)

```

### Arguments

|                                 |   |
|---------------------------------|---|
| <code>data</code>               | This is your source data  |
| <code>FC_Periods</code>         | The number of periods you set up to forecast  |
| <code>SaveData</code>           | Set to TRUE to save the output data to file   |
| <code>FilePath</code>           | Set a path file have the data saved there   |
| <code>TargetVariableName</code> | Name or column number of your target variable   |
| <code>DateVariableName</code>   | Name or column number of your date variable   |
| <code>GroupingVariables</code>  | Name or column number of your group variables   |
| <code>Lags</code>               | The number of lags used in building the modeling data sets  |
| <code>MovingAverages</code>     | The number of moving averages used in building the modeling data sets   |
| <code>TimeTrendVariable</code>  | Set to TRUE if you did so in model data creation  |
| <code>TimeUnit</code>           | Set to the same time unit used in modeling data creation  |
| <code>CurrentDate</code>        | Set this to the current date or a date that you want. It is user specified in case you want to score historical data. |
| <code>CalendarVariables</code>  | Set this to the same setting you used in modeling data creation   |
| <code>HolidayGroups</code>      | Set this to the same setting you used in modeling data creation   |

### Value

Returns the most recent records for every level of your grouping variables with all the feature used in model building

  Bins = 10,
  ModelType = "xgboost",
  NThreads = parallel::detectCores(),
  MaxMem = "32G",
  ModelPath = NULL,
  ModelID = NULL
)

```

**Arguments**

|           |  |
|-----------|--|
| data      | Supply a training data set. This data set should be the data right before it gets converted to an h2o, catboost, or xgboost data object. |
| Model     | Supply the model returned from training with the Auto__() functions.   |
| Bins      | Number of bins for discretizing numeric features   |
| ModelType | Select from xgboost, h2o, and catboost   |
| NThreads  | Number of CPU threads  |
| MaxMem    | For use with H2O models. E.g. set to "28G"   |
| ModelPath | Set to the path where your ML model is saved   |
| ModelID   | ID used to identify your ML model  |

**Value**

Model for utilizing lime

|               |  |
|---------------|--|
| ModelDataPrep | <i>Final Data Preparation Function</i> |
|---------------|--|

---

**Description**

This function replaces inf values with NA, converts characters to factors, and imputes with constants

**Usage**

```
ModelDataPrep(
  data,
  Impute = TRUE,
  CharToFactor = TRUE,
  FactorToChar = FALSE,
  IntToNumeric = TRUE,
  DateToChar = FALSE,
  RemoveDates = FALSE,
  MissFactor = "0",
  MissNum = -1,
  IgnoreCols = NULL
)
```

**Arguments**

|              |  |
|--------------|--|
| data         | This is your source data you'd like to modify                              |
| Impute       | Defaults to TRUE which tells the function to impute the data               |
| CharToFactor | Defaults to TRUE which tells the function to convert characters to factors |
| FactorToChar | Converts to character  |
| IntToNumeric | Defaults to TRUE which tells the function to convert integers to numeric   |
| DateToChar   | Converts date columns into character columns                               |
| RemoveDates  | Defaults to FALSE. Set to TRUE to remove date columns from your data.table |
| MissFactor   | Supply the value to impute missing factor levels                           |
| MissNum      | Supply the value to impute missing numeric values                          |
| IgnoreCols   | Supply column numbers for columns you want the function to ignore          |

**Value**

Returns the original data table with corrected values

**Author(s)**

Adrian Antico

OptimizeArfima

*OptimizeArfima is a function that takes raw data and returns time series data*

---

## Description

OptimizeArfima is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

## Usage

```

OptimizeArfima(
  Output,
  MetricSelection = "MAE",
  DataSetName = NULL,
  train = NULL,
  test = NULL,
  Lags = NULL,
  MovingAverages = NULL,
  FullData = NULL,
  HoldOutPeriods = NULL,
  MinVal = NULL,
  TargetName = NULL,
  DateName = NULL,
  TrainValidateShare = NULL,
  FinalGrid = NULL
)

```

## Arguments

|                 |  |
|-----------------|--|
| Output          | This is passed through as output from TimeSeriesDataPrepare() and passed through ParallelArima() |
| MetricSelection | Select from "MSE", "MAE", or "MAPE"  |
| DataSetName     | This is the name of the data set passed through in parallel loop                                 |
| train           | Training data returned from TimeSeriesDataPrepare()  |
| test            | Test data returned from TimeSeriesDataPrepare()  |
| Lags            | Max lags   |
| MovingAverages  | Max moving averages  |

|                    |   |
|--------------------|---|
| FullData           | Full series data for scoring and ensemble   |
| HoldOutPeriods     | Holdout periods returned from TimeSeriesDataPrepare()   |
| MinVal             | Minimum value of target variable returned from TimeSeriesDataPrepare()  |
| TargetName         | Target variable name returned from TimeSeriesDataPrepare()  |
| DateName           | Date variable name returned from TimeSeriesDataPrepare()  |
| TrainValidateShare | A two-element numeric vector. The first element is the weight applied to the training performance and the remainder is applied to the validation performance. |
| FinalGrid          | Grid for forecasting models   |

**Value**

Time series data sets to pass onto auto modeling functions

---

|              |  |
|--------------|--|
| OptimizeTSLM | <i>OptimizeTSLM is a function that takes raw data and returns time series data</i> |
|--------------|--|

---

Description

OptimizeTSLM is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

**Usage**

```
OptimizeTSLM(
  Output,
  MetricSelection = "MAE",
  DataSetName = NULL,
  train = NULL,
  test = NULL,
  FullData = NULL,
  HoldOutPeriods = NULL,
  MinVal = NULL,
  TargetName = NULL,
  DateName = NULL,
  TrainValidateShare = NULL,
  FinalGrid = NULL
)
```

**Arguments**

|                    |   |
|--------------------|---|
| Output             | This is passed through as output from TimeSeriesDataPrepare() and passed through ParallelArima()  |
| MetricSelection    | Select from "MSE", "MAE", or "MAPE"   |
| DataSetName        | This is the name of the data set passed through in parallel loop  |
| train              | Training data returned from TimeSeriesDataPrepare()   |
| test               | Test data returned from TimeSeriesDataPrepare()   |
| FullData           | Full series data for scoring and ensemble   |
| HoldOutPeriods     | Holdout periods returned from TimeSeriesDataPrepare()   |
| MinVal             | Minimum value of target variable returned from TimeSeriesDataPrepare()  |
| TargetName         | Target variable name returned from TimeSeriesDataPrepare()  |
| DateName           | Date variable name returned from TimeSeriesDataPrepare()  |
| TrainValidateShare | A two-element numeric vector. The first element is the weight applied to the training performance and the remainder is applied to the validation performance. |
| FinalGrid          | Grid for forecasting models   |

**Value**

Time series data sets to pass onto auto modeling functions

|                |  |
|----------------|--|
| ParDepCalPlots | <i>ParDepCalPlots automatically builds partial dependence calibration plots for model evaluation</i> |
|----------------|--|

---

Description

This function automatically builds partial dependence calibration plots and partial dependence calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```
ParDepCalPlots(
  data,
  PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"),
  IndepVar = c("Independent_Variable_Name"),
```

```

    GraphType = c("calibration"),
    PercentileBucket = 0.05,
    FactLevels = 10,
    Function = function(x) mean(x, na.rm = TRUE)
  )

```

### Arguments

|                                |   |
|--------------------------------|---|
| <code>data</code>              | Data containing predicted values and actual values for comparison   |
| <code>PredictionColName</code> | Predicted values column names   |
| <code>TargetColName</code>     | Target value column names   |
| <code>IndepVar</code>          | Independent variable column names   |
| <code>GraphType</code>         | calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation                                |
| <code>PercentileBucket</code>  | Number of buckets to partition the space on (0,1) for evaluation  |
| <code>FactLevels</code>        | The number of levels to show on the chart (1. Levels are chosen based on frequency; 2. all other levels grouped and labeled as "Other") |
| <code>Function</code>          | Supply the function you wish to use for aggregation.  |

### Value

Partial dependence calibration plot or boxplot

**Partial\_DT\_GDL\_Feature\_Engineering**

*A version of the DT\_GDL function for creating the GDL features for a new set of records*

---

**Description**

For scoring models in production that have > 1 grouping variables and for when you need > 1 record (or records per grouping variables) returned. This function is for generating lags and moving averages (along with lags and moving averages off of time between records), for a partial set of records in your data set, typical new records that become available for model scoring. Column names and ordering will be identical to the output from the corresponding DT\_GDL\_Feature\_Engineering() function, which most likely was used to create features for model training.

**Usage**

```
Partial_DT_GDL_Feature_Engineering(
  data,
  lags = c(seq(1, 5, 1)),
  periods = c(3, 5, 10, 15, 20, 25),
  SDperiods = c(seq(5, 95, 5)),
  Skewperiods = c(seq(5, 95, 5)),
  Kurtperiods = c(seq(5, 95, 5)),
  Quantileperiods = c(seq(5, 95, 5)),
  statsFUNs = c("mean"),
  targets = c("Target"),
  groupingVars = NULL,
  sortDateName = NULL,
  timeDiffTarget = NULL,
  timeAgg = NULL,
  WindowingLag = 1,
  Type = "Lag",
  Timer = TRUE,
  SimpleImpute = TRUE,
  AscRowByGroup = "temp",
  RecordsKeep = 1,
  AscRowRemove = TRUE
)
```

**Arguments**

|             |   |
|-------------|---|
| data        | A data.table you want to run the function on  |
| lags        | A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.       |
| periods     | A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.       |
| SDperiods   | A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations. |
| Skewperiods | A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.           |

|                 |  |
|-----------------|--|
| Kurtperiods     | A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.  |
| Quantileperiods | A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.  |
| statsFUNs       | Select from the following c("mean","sd","skew","kurt","q5","q10","q15","q20","q25","q30","q35","q40","q45","q50")  |
| targets         | A character vector of the column names for the reference column in which you will build your lags and rolling stats  |
| groupingVars    | A character vector of categorical variable names you will build your lags and rolling stats by   |
| sortDateName    | The column name of your date column used to sort events over time  |
| timeDiffTarget  | Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.                         |
| timeAgg         | List the time aggregation level for the time between events features, such as "hour", "day", "week", "month", "quarter", or "year"                               |
| WindowingLag    | Set to 0 to build rolling stats off of target columns directly or set to 1 to build the rolling stats off of the lag-1 target                                    |
| Type            | List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values  |
| Timer           | Set to TRUE if you percentage complete tracker printout  |
| SimpleImpute    | Set to TRUE for factor level imputation of "0" and numeric imputation of -1  |
| AscRowByGroup   | Required to have a column with a Row Number by group (if grouping) with the smallest numbers being the records for scoring (typically the most current in time). |
| RecordsKeep     | List the row number of AscRowByGroup and those data points will be returned  |
| AscRowRemove    | Set to TRUE to remove the AscRowByGroup column upon returning data.  |

**Value**

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

## End(Not run)

```

---

PredictArima

---

*PredictArima to forecast an Arima() model from the stats package*

---

## Description

PredictArima is a function to overwrite the s3 generic `getS3method('predict','Arima')`

## Usage

```

PredictArima(
  object = Results,
  n.ahead = FCPeriods,
  newxreg = NULL,
  se.fit = TRUE
)

```

## Arguments

|                      |   |
|----------------------|---|
| <code>object</code>  | Object that stores the output from Arima()                            |
| <code>n.ahead</code> | Number of forecast periods to forecast                                |
| <code>newxreg</code> | NULL by default. Forward looking independent variables as matrix type |
| <code>se.fit</code>  | Set to FALSE to not return prediction intervals with the forecast     |

| PrintObjectsSize | <i>PrintObjectsSize prints out the top N objects and their associated sizes, sorted by size</i> |
|------------------|---|

---

**Description**

PrintObjectsSize prints out the top N objects and their associated sizes, sorted by size

**Usage**

```
PrintObjectsSize(N = 10)
```

**Arguments**

|   |                                  |
|---|----------------------------------|
| N | The number of objects to display |
|---|----------------------------------|

**Value**

A print to your console of the sizes of the objects in your environment

|---------------------|---|
| ProblematicFeatures | <i>ProblematicFeatures identifies problematic features for machine learning</i> |
|---------------------|---|

---

## Description

ProblematicFeatures identifies problematic features for machine learning and outputs a data.table of the feature names in the first column and the metrics they failed to pass in the columns.

## Usage

```
ProblematicFeatures(
  data,
  ColumnNumbers = c(1:ncol(data)),
  NearZeroVarThresh = 0.05,
  CharUniqThresh = 0.5,
  NA_Rate = 0.2,
  Zero_Rate = 0.2,
  HighSkewThresh = 10
)
```

## Arguments

|                   |  |
|-------------------|--|
| data              | The data.table with the columns you wish to have analyzed  |
| ColumnNumbers     | A vector with the column numbers you wish to analyze   |
| NearZeroVarThresh | Set to NULL to not run NearZeroVar(). Checks to see if the percentage of values in your numeric columns that are not constant are greater than the value you set here. If not, the feature is collected and returned with the percentage unique value. |
| CharUniqThresh    | Set to NULL to not run CharUniqthresh(). Checks to see if the percentage of unique levels / groups in your categorical feature is greater than the value you supply. If it is, the feature name is returned with the percentage unique value.          |
| NA_Rate           | Set to NULL to not run NA_Rate(). Checks to see if the percentage of NA's in your features is greater than the value you supply. If it is, the feature name is returned with the percentage of NA values.  |
| Zero_Rate         | Set to NULL to not run Zero_Rate(). Checks to see if the percentage of zero's in your features is greater than the value you supply. If it is, the feature name is returned with the percentage of zero values.  |
| HighSkewThresh    | Set to NULL to not run HighSkew(). Checks for numeric columns whose ratio of the sum of the top 5th percentile of values to the bottom 95th percentile of values is greater than the value you supply. If true, the column name and value is returned. |

## Value

data table with new dummy variables columns and optionally removes base columns

QA\_WALMARTDATAGENERATOR

*QA\_WALMARTDATAGENERATOR*

---

Description

QA\_WALMARTDATAGENERATOR

Usage

QA\_WALMARTDATAGENERATOR(data, Groups = 1L, TimeUnit\_\_ = "WEEK")

Arguments

|            |   |
|------------|---|
| data       | supply walmart data for either a single group or two group case. For no group, use XX |
| Groups     | Supply either 0L, 1L, or 2L to indicate the number of group variables to have tested  |
| TimeUnit__ | = TimeUnit_   |

|----------------|--|
| RedYellowGreen | <i>RedYellowGreen is for determining the optimal thresholds for binary classification when do-nothing is an option</i> |
|----------------|--|

---

## Description

This function will find the optimal thresholds for applying the main label and for finding the optimal range for doing nothing when you can quantify the cost of doing nothing

## Usage

```
RedYellowGreen(
  data,
  PredictColNumber = 2,
  ActualColNumber = 1,
  TruePositiveCost = 0,
  TrueNegativeCost = 0,
  FalsePositiveCost = -10,
  FalseNegativeCost = -50,
  MidTierCost = -2,
  Cores = 8,
  Precision = 0.01,
  Boundaries = c(0.05, 0.75)
)
```

## Arguments

|                   |  |
|-------------------|--|
| data              | data is the data table with your predicted and actual values from a classification model   |
| PredictColNumber  | The column number where the prediction variable is located (in binary form)  |
| ActualColNumber   | The column number where the target variable is located   |
| TruePositiveCost  | This is the utility for generating a true positive prediction  |
| TrueNegativeCost  | This is the utility for generating a true negative prediction  |
| FalsePositiveCost | This is the cost of generating a false positive prediction   |
| FalseNegativeCost | This is the cost of generating a false negative prediction   |
| MidTierCost       | This is the cost of doing nothing (or whatever it means to not classify in your case)  |
| Cores             | Number of cores on your machine  |
| Precision         | Set the decimal number to increment by between 0 and 1   |
| Boundaries        | Supply a vector of two values c(lower bound, upper bound) where the first value is the smallest threshold you want to test and the second value is the largest value you want to test. Note, if your results are at the boundaries you supplied, you should extent the boundary that was reached until the values is within both revised boundaries. |

**Value**

```

---

**ResidualOutliers***ResidualOutliers is an automated time series outlier detection function*

---

## Description

ResidualOutliers is an automated time series outlier detection function that utilizes tsoutliers and auto.arima. It looks for five types of outliers: "AO" Additive outlier - a singular extreme outlier that surrounding values aren't affected by; "IO" Innovational outlier - Initial outlier with subsequent anomalous values; "LS" Level shift - An initial outlier with subsequent observations being shifted by some constant on average; "TC" Transient change - initial outlier with lingering effects that dissipate exponentially over time; "SLS" Seasonal level shift - similar to level shift but on a seasonal scale.

## Usage

```
ResidualOutliers(
  data,
  DateColName = "DateTime",
  TargetColName = "Target",
  PredictedColName = NULL,
  TimeUnit = "day",
  Lags = 5,
  MA = 5,
  SLags = 0,
  SMA = 0,
  tstat = 2
)
```

## Arguments

|                  |  |
|------------------|--|
| data             | the source residuals data.table  |
| DateColName      | The name of your data column to use in reference to the target variable  |
| TargetColName    | The name of your target variable column  |
| PredictedColName | The name of your predicted value column. If you supply this, you will run anomaly detection of the difference between the target variable and your predicted value. If you leave PredictedColName NULL then you will run anomaly detection over the target variable. |
| TimeUnit         | The time unit of your date column: hour, day, week, month, quarter, year   |
| Lags             | the largest lag or moving average (seasonal too) values for the arima fit  |
| MA               | Max moving average   |
| SLags            | Max seasonal lags  |
| SMA              | Max seasonal moving averages   |
| tstat            | the t-stat value for tsoutliers  |

## Value

A named list containing FullData = original data.table with outliers data and ARIMA\_MODEL = the arima model.

|-----------|------------------|
| RL_Update | <i>RL_Update</i> |
|-----------|------------------|

---

**Description**

RL\_Update updates the bandit probabilities for selecting different grids

**Usage**

```
RL_Update(
  ExperimentGrid = ExperimentGrid,
  MetricSelection = MetricSelection,
  ModelRun = run,
  NEWGrid = NewGrid,
  TrialVector = Trials,
  SuccessVector = Successes,
  GridIDS = GridIDS,
  BanditArmsCount = BanditArmsN,
  RunsWithoutNewWinner = RunsWithoutNewWinner,
  MaxRunsWithoutNewWinner = MaxRunsWithoutNewWinner,
  MaxNumberModels = MaxNumberModels,
  MaxRunMinutes = MaxRunMinutes,
  TotalRunTime = TotalRunTime,
  BanditProbabilities = BanditProbs
)
```

**Arguments**

|                         |   |
|-------------------------|---|
| ExperimentGrid          | This is a data.table of grid params and model results                       |
| MetricSelection         | The chosen metric to evaluate models  |
| ModelRun                | Model iteration number  |
| NEWGrid                 | Previous grid passed in   |
| TrialVector             | Numeric vector with the total trials for each arm                           |
| SuccessVector           | Numeric vector with the total successes for each arm                        |
| GridIDS                 | The numeric vector that identifies which grid is which                      |
| BanditArmsCount         | The number of arms in the bandit  |
| RunsWithoutNewWinner    | Counter of the number of models previously built without being a new winner |
| MaxRunsWithoutNewWinner | Maximum number of models built without a new best model (constraint)        |
| MaxNumberModels         | Maximum number of models to build (constraint)                              |
| MaxRunMinutes           | Run time constraint   |
| TotalRunTime            | Cumulative run time in minutes  |
| BanditProbabilities     | Initial probabilities from RL_Initialize()                                  |

|                     |                            |
|---------------------|----------------------------|
| RPM_Binomial_Bandit | <i>RPM_Binomial_Bandit</i> |
|---------------------|----------------------------|

---

## Description

RPM\_Binomial\_Bandit computes randomized probability matching probabilities for each arm being best in a multi-armed bandit. Close cousin to Thomson Sampling.

## Usage

```
RPM_Binomial_Bandit(  
  Success,  
  Trials,  
  Alpha = 1L,  
  Beta = 1L,  
  SubDivisions = 1000L  
)
```

## Arguments

|              |   |
|--------------|---|
| Success      | Vector of successes. One slot per arm.                                      |
| Trials       | Vector of trials. One slot per arm.   |
| Alpha        | Prior parameter for success   |
| Beta         | Prior parameter for trials  |
| SubDivisions | Default is 100L in the stats package. Changed it to 1000 for this function. |

## Value

Probability of each arm being the best arm compared to all other arms.

StackedTimeSeriesEnsembleForecast

*TimeSeriesEnsembleForecast*

---

**Description**

TimeSeriesEnsembleForecast to generate forecasts and ensemble data

**Usage**

```
StackedTimeSeriesEnsembleForecast(
  TS_Models = c("arima", "tbats", "nnet"),
  ML_Methods = c("CatBoost", "XGBoost", "H2oGBM", "H2oDRF"),
  CalendarFeatures = TRUE,
  HolidayFeatures = TRUE,
  FourierFeatures = NULL,
  Path = "C:/Users/aantico/Documents/Package",
  TargetName = "Weekly_Sales",
  DateName = "Date",
  NTrees = 750,
  TaskType = "GPU",
  GridTune = FALSE,
  FCPeriods = 5,
  MaxNumberModels = 5
)
```

**Arguments**

|                  |  |
|------------------|--|
| TS_Models        | Select which ts model forecasts to ensemble              |
| ML_Methods       | Select which models to build for the ensemble            |
| CalendarFeatures | TRUE or FALSE  |
| HolidayFeatures  | TRUE or FALSE  |
| FourierFeatures  | Full set of fourier features for train and score         |
| Path             | The path to the folder where the ts forecasts are stored |
| TargetName       | "Weekly_Sales"   |
| DateName         | "Date"   |
| NTrees           | Select the number of trees to utilize in ML models       |
| TaskType         | GPU or CPU   |
| GridTune         | Set to TRUE to grid tune the ML models                   |
| FCPeriods        | Number of periods to forecast                            |
| MaxNumberModels  | The number of models to try for each ML model            |

```

---

threshOptim

Utility maximizing thresholds for binary classification

---

### Description

This function will return the utility maximizing threshold for future predictions along with the data generated to estimate the threshold

**Usage**

```
threshOptim(
  data,
  actTar = "target",
  predTar = "p1",
  tpProfit = 0,
  tnProfit = 0,
  fpProfit = -1,
  fnProfit = -2,
  MinThresh = 0.001,
  MaxThresh = 0.999,
  ThresholdPrecision = 0.001
)
```

**Arguments**

|                    |  |
|--------------------|--|
| data               | data is the data table you are building the modeling on                      |
| actTar             | The column name where the actual target variable is located (in binary form) |
| predTar            | The column name where the predicted values are located                       |
| tpProfit           | This is the utility for generating a true positive prediction                |
| tnProfit           | This is the utility for generating a true negative prediction                |
| fpProfit           | This is the cost of generating a false positive prediction                   |
| fnProfit           | This is the cost of generating a false negative prediction                   |
| MinThresh          | Minimum value to consider for model threshold                                |
| MaxThresh          | Maximum value to consider for model threshold                                |
| ThresholdPrecision | Incrementing value in search   |

**Value**

Optimal threshold and corresponding utilities for the range of thresholds tested

---

TimeSeriesDataPrepare *TimeSeriesDataPrepare is a function that takes raw data and returns time series data*

---

## Description

TimeSeriesDataPrepare is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

## Usage

```

TimeSeriesDataPrepare(
  data,
  TargetName,
  DateName,
  Lags,
  SeasonalLags,
  MovingAverages,
  SeasonalMovingAverages,
  TimeUnit,
  FCPeriods,
  HoldOutPeriods,
  TSClean = TRUE,
  ModelFreq = TRUE,
  FinalBuild = FALSE
)

```

## Arguments

|                        |  |
|------------------------|--|
| data                   | Source data.table for forecasting                |
| TargetName             | Name of your target variable                     |
| DateName               | Name of your date variable                       |
| Lags                   | The max number of lags you want to test          |
| SeasonalLags           | The max number of seasonal lags you want to test |
| MovingAverages         | The max number of moving average terms           |
| SeasonalMovingAverages | The max number of seasonal moving average terms  |

|                |   |
|----------------|---|
| TimeUnit       | The level of aggregation your dataset comes in. Choices include: 1Min, 5Min, 10Min, 15Min, and 30Min, hour, day, week, month, quarter, year |
| FCPeriods      | The number of forecast periods you want to have forecasted  |
| HoldOutPeriods | The number of holdout samples to compare models against   |
| TSClean        | TRUE or FALSE. TRUE will kick off a time series cleaning operation. Outliers will be smoothed and imputation will be conducted.             |
| ModelFreq      | TRUE or FALSE. TRUE will enable a model-based time frequency calculation for an alternative frequency value to test models on.              |
| FinalBuild     | Set to TRUE to create data sets with full data  |

**Value**

Time series data sets to pass onto auto modeling functions

**Author(s)**

Adrian Antico

**See Also**

**Examples**

```
## Not run:
data <- data.table::fread(
  file.path(PathNormalizer(
    "C:\\Users\\aantico\\Documents\\Package\\data"),
    "tsdata.csv"))
TimeSeriesDataPrepare(
  data = data,
  TargetName = "Weekly_Sales",
  DateName = "Date",
  Lags = 5,
  MovingAverages,
  SeasonalMovingAverages,
  SeasonalLags = 1,
  TimeUnit = "week",
  FCPeriods = 10,
  HoldOutPeriods = 10,
  TSClean = TRUE,
  ModelFreq = TRUE,
  FinalBuild = FALSE)

## End(Not run)
```

TimeSeriesFill

*TimeSeriesFill For Completing Time Series Data***Description**

TimeSeriesFill For Completing Time Series Data For Single Series or Time Series by Group

**Usage**

```
TimeSeriesFill(
  data = data,
  DateColumnName = "Date",
  GroupVariables = NULL,
  TimeUnit = "days",
  FillType = "all"
)
```

**Arguments**

|                |   |
|----------------|---|
| data           | Supply your full series data set here   |
| DateColumnName | Supply the name of your date column   |
| GroupVariables | Supply the column names of your group variables. E.g. "Group" or c("Group1", "Group2")  |
| TimeUnit       | Choose from "second", "minute", "hour", "day", "week", "month", "quarter", "year"   |
| FillType       | Choose from "all" or "inner". Only relevant for when you have GroupVariables. The "all" option will take the max date and the min date of the entire data set and fill according to those. The "inner" option will grab the max and min dates by group levels and fill each group level based on those. |

**Value**

Returns a data table with missing time series records filled (currently just zeros)

    LevelsToDisplay = NULL,
    OtherGroupLabel = "Other",
    DisplayOtherGroup = FALSE,
    TextSize = 12,
    LineWidth = 1,
    Color = "blue",
    XTickMarks = "1 year",
    Size = 12,
    AngleX = 35,
    AngleY = 0,
    ChartColor = "lightsteelblue1",
    BorderColor = "darkblue",
    TextColor = "darkblue",
    GridColor = "white",
    BackGroundColor = "gray95",
    LegendPosition = "bottom",
    LegendTextColor = "darkblue",
    LegendTextSize = 10,
    ForecastLineColor = "black",
    Forecast = FALSE,
    PredictionIntervals = FALSE,
    TS_ModelID = NULL,
    PredictionIntervalColorInner = "aquamarine1",
    PredictionIntervalColorOuter = "peachpuff1"
)

```

### Arguments

|                     |   |
|---------------------|---|
| data                | Source data   |
| TargetVariable      | Target variable   |
| DateVariable        | Date variable   |
| GroupVariables      | Group variables   |
| VLineDate           | Date of last actual target value  |
| Aggregate           | Choose from 'sum' or 'mean'   |
| NumberGroupsDisplay | Number of lines to display  |
| LevelsToDisplay     | Value   |
| OtherGroupLabel     | Label to call all other group levels  |
| DisplayOtherGroup   | If TRUE, a line will be shown with all levels that fall into 'other' otherwise no line will be shown  |
| TextSize            | Default 12  |
| LineWidth           | Numeric value. Default is 1   |
| Color               | Set to "blue", "red", etc   |
| XTickMarks          | Number of tick marks on x-axis. "1 minute", "15 minutes", "30 minutes", "1 hour", "3 hour", "6 hour", "12 hour", "1 day", "3 day", "1 week", "2 week", "1 month", "3 month", "6 month", "1 year", "2 year", "5 year", "10 year" |

|                              |   |
|------------------------------|---|
| Size                         | Size of text on plot                                |
| AngleX                       | Angle of text on x axis                             |
| AngleY                       | Angle of text on y axis                             |
| ChartColor                   | Color of chart background                           |
| BorderColor                  | Color of border                                     |
| TextColor                    | Text color  |
| GridColor                    | Grid color  |
| BackgroundColor              | Background color                                    |
| LegendPosition               | Legend position                                     |
| LegendTextColor              | Text color  |
| LegendTextSize               | Text size   |
| ForecastLineColor            | Forecast line color                                 |
| Forecast                     | Set to TRUE to use forecast plots                   |
| PredictionIntervals          | Set to TRUE to plot prediction intervals            |
| TS_ModelID                   | Select a model from the list for forecasting viewer |
| PredictionIntervalColorInner | Fills 20th to 80th percentiles                      |
| PredictionIntervalColorOuter | Fills 5th to 20th and 80th to 95th percentiles      |

WideTimeSeriesEnsembleForecast

*WideTimeSeriesEnsembleForecast*

---

**Description**

WideTimeSeriesEnsembleForecast to generate forecasts and ensemble data

**Usage**

```
WideTimeSeriesEnsembleForecast(
  TS_Models = c("arima", "tbats", "nnet"),
  ML_Methods = c("CatBoost", "XGBoost", "H2oGBM", "H2oDRF"),
  Path = "C:/Users/aantico/Documents/Package",
  TargetName = "Weekly_Sales",
  DateName = "Date",
  NTrees = 750,
  TaskType = "GPU",
  GridTune = FALSE,
  MaxNumberModels = 5
)
```

**Arguments**

|                 |  |
|-----------------|--|
| TS_Models       | Select which ts model forecasts to ensemble              |
| ML_Methods      | Select which models to build for the ensemble            |
| Path            | The path to the folder where the ts forecasts are stored |
| TargetName      | "Weekly_Sales"   |
| DateName        | "Date"   |
| NTrees          | Select the number of trees to utilize in ML models       |
| TaskType        | GPU or CPU   |
| GridTune        | Set to TRUE to grid tune the ML models                   |
| MaxNumberModels | The number of models to try for each ML model            |
