Package ‘RemixAutoML’

April 14, 2021

Title Remix Automated Machine Learning

Version 0.5.1

Date 2021-04-02

Maintainer Adrian Antico <adrianantico@gmail.com>

Description R package for the automation of machine learning, forecasting, feature engineering, model evaluation, model interpretation, data generation, and recommenders. Built using data.table for all tabular data-related tasks.

License MPL-2.0 | file LICENSE

URL https://github.com/AdrianAntico/RemixAutoML

BugReports https://github.com/AdrianAntico/RemixAutoML/issues

Depends R (>= 3.5.0)

Imports arules, bit64, catboost, combinat, data.table, doParallel, e1071, fBasics, foreach, forecast, ggplot2, grid, h2o, itertools, lubridate, methods, MLmetrics, nortest, parallel, pROC, RColorBrewer, recommenderlab, Rfast, scatterplot3d, stats, stringr, timeDate, tsoutliers, xgboost

Suggests knitr, rmarkdown, fpp, gridExtra

VignetteBuilder knitr

RemixAutoML-package *Automated Machine Learning Remixed*

Description

Automated Machine Learning Remixed for real-world use-cases. The package utilizes data.table under the hood for all data wrangling like operations so it's super fast and memory efficient. All ML methods are available in R or Python. The forecasting functions are unique and state of the art. There are feature engineering functions in this package that you cannot find anywhere else.

Details

See the github README for details and examples www.github.com/AdrianAntico/RemixAutoML

AutoArfima *AutoArfima*

Description

AutoArfima is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The paramter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```
AutoArfima(
  data,
  FilePath = NULL,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
```

```
  MaxLags = 5L,
  MaxMovingAverages = 5L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, min(4L, parallel::detectCores() - 2L))
)
```

Arguments

`data` Source data.table

`FilePath` NULL to return nothing. Provide a file path to save the model and xregs if available

`TargetVariableName` Name of your time series target variable

`DateColumnName` Name of your date column

`TimeAggLevel` Choose from "year", "quarter", "month", "week", "day", "hour"

`EvaluationMetric` Choose from MAE, MSE, and MAPE

`NumHoldOutPeriods` Number of time periods to use in the out of sample testing

`NumFCPeriods` Number of periods to forecast

`MaxLags` A single value of the max number of lags to use in the internal auto.arima of tbats

`MaxMovingAverages` A single value of the max number of moving averages to use in the internal auto.arima of arfima

`TrainWeighting` Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.

`MaxConsecutiveFails` When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attemps without a new winner before terminating the procedure.

`MaxNumberModels` Indicate the maximum number of models to test.

`MaxRunTimeMinutes` Indicate the maximum number of minutes to wait for a result.

`NumberCores` Default max(1L, min(4L, parallel::detectCores()-2L))

Examples

```
## Not run:
# Create fake data
data <- RemixAutoML::FakeDataGenerator(TimeSeries = TRUE, TimeSeriesTimeAgg = "days")

# Build model
Output <- RemixAutoML::AutoArfima(
  data,
  FilePath = NULL,
  TargetVariableName = "Weekly_Sales",
  DateColumnName = "Date",
  TimeAggLevel = "weeks",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxMovingAverages = 5L,
  TrainWeighting = 0.50,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, min(4L, parallel::detectCores()-2L)))

# Output
Output$ForecastPlot
Output$Forecast
Output$PerformanceGrid

## End(Not run)
```

`AutoBanditNNet` *AutoBanditNNet*

Description

AutoBanditNNet is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The paramter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```
AutoBanditNNet(
```

```
  data,
  FilePath = NULL,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxSeasonalLags = 1L,
  MaxFourierPairs = 2L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, min(4L, parallel::detectCores() - 2L)),
  Debug = FALSE
)
```

Arguments

`data`	Source data.table
`FilePath`	NULL to return nothing. Provide a file path to save the model and xregs if available
`TargetVariableName`	Name of your time series target variable
`DateColumnName`	Name of your date column
`TimeAggLevel`	Choose from "year", "quarter", "month", "week", "day", "hour"
`EvaluationMetric`	Choose from MAE, MSE, and MAPE
`NumHoldOutPeriods`	Number of time periods to use in the out of sample testing
`NumFCPeriods`	Number of periods to forecast
`MaxLags`	A single value of the max number of lags to test
`MaxSeasonalLags`	A single value of the max number of seasonal lags to test
`MaxFourierPairs`	A single value of the max number of fourier pairs to test
`TrainWeighting`	Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.
`MaxConsecutiveFails`	When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attemps without a new winner before terminating the procedure.
`MaxNumberModels`	Indicate the maximum number of models to test.
`MaxRunTimeMinutes`	Indicate the maximum number of minutes to wait for a result
`NumberCores`	Default max(1L, min(4L, parallel::detectCores()-2L))
`Debug`	Set to TRUE to print some steps

AutoBanditSarima *AutoBanditSarima*

Description

AutoBanditSarima is a multi-armed bandit model testing framework for SARIMA. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic auto.arima from the forecast package. Depending on how many lags, moving averages, seasonal lags and moving averages you test the number of combinations of features to test begins to approach 100,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags and moving averages. The paramter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```
AutoBanditSarima(
  data,
  FilePath = NULL,
  ByDataType = TRUE,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxSeasonalLags = 0L,
  MaxMovingAverages = 5L,
  MaxSeasonalMovingAverages = 0L,
  MaxFourierPairs = 2L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 25L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, min(4L, parallel::detectCores() - 2L)),
  DebugMode = FALSE
)
```

Arguments

`data`	Source data.table
`FilePath`	NULL to return nothing. Provide a file path to save the model and xregs if available
`ByDataType`	TRUE returns the best model from the four base sets of possible models. FALSE returns the best model.
`TargetVariableName`	Name of your time series target variable
`DateColumnName`	Name of your date column
`TimeAggLevel`	Choose from "year", "quarter", "month", "week", "day", "hour"
`EvaluationMetric`	Choose from MAE, MSE, and MAPE
`NumHoldOutPeriods`	Number of time periods to use in the out of sample testing
`NumFCPeriods`	Number of periods to forecast
`MaxLags`	A single value of the max number of lags to test
`MaxSeasonalLags`	A single value of the max number of seasonal lags to test

MaxMovingAverages
: A single value of the max number of moving averages to test

MaxSeasonalMovingAverages
: A single value of the max number of seasonal moving averages to test

MaxFourierPairs
: A single value of the max number of fourier pairs to test

TrainWeighting
: Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.

MaxConsecutiveFails
: When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attemps without a new winner before terminating the procedure.

MaxNumberModels
: Indicate the maximum number of models to test.

MaxRunTimeMinutes
: Indicate the maximum number of minutes to wait for a result.

NumberCores
: Default max(1L, min(4L, parallel::detectCores()-2L))

DebugMode
: Set to TRUE to get print outs of particular steps helpful in tracing errors

Value

data.table containing historical values and the forecast values along with the grid tuning results in full detail, as a second data.table

AutoCatBoostCARMA *AutoCatBoostCARMA*

Description

AutoCatBoostCARMA Mutlivariate Forecasting with calendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```
AutoCatBoostCARMA(
  data,
  TimeWeights = NULL,
  NonNegativePred = FALSE,
  RoundPreds = FALSE,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",
  HierarchGroups = NULL,
  GroupVariables = NULL,
  FC_Periods = 30,
  TimeUnit = "week",
  TimeGroups = c("weeks", "months"),
  PDFOutputPath = NULL,
  SaveDataPath = NULL,
  NumOfParDepPlots = 10L,
  TargetTransformation = FALSE,
  Methods = c("BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", "Logit"),
  AnomalyDetection = NULL,
  XREGS = NULL,
  Lags = c(1L:5L),
```

```
  MA_Periods = c(2L:5L),
  SD_Periods = NULL,
  Skew_Periods = NULL,
  Kurt_Periods = NULL,
  Quantile_Periods = NULL,
  Quantiles_Selected = c("q5", "q95"),
  Difference = TRUE,
  FourierTerms = 6L,
  CalendarVariables = c("minute", "hour", "wday", "mday", "yday", "week", "isoweek",
    "month", "quarter", "year"),
  HolidayVariable = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
    "OtherEcclesticalFeasts"),
  HolidayLookback = NULL,
  HolidayLags = 1L,
  HolidayMovingAverages = 1L:2L,
  TimeTrendVariable = FALSE,
  ZeroPadSeries = NULL,
  DataTruncate = FALSE,
  SplitRatios = c(0.7, 0.2, 0.1),
  PartitionType = "timeseries",
  TaskType = "GPU",
  NumGPU = 1,
  DebugMode = FALSE,
  EvalMetric = "RMSE",
  EvalMetricValue = 1.5,
  LossFunction = "RMSE",
  LossFunctionValue = 1.5,
  GridTune = FALSE,
  PassInGrid = NULL,
  ModelCount = 100,
  MaxRunsWithoutNewWinner = 50,
  MaxRunMinutes = 24L * 60L,
  Langevin = FALSE,
  DiffusionTemperature = 10000,
  NTrees = 1000,
  L2_Leaf_Reg = 3,
  LearningRate = NULL,
  RandomStrength = 1,
  BorderCount = 254,
  Depth = 6,
  RSM = 1,
  BootStrapType = NULL,
  GrowPolicy = "SymmetricTree",
  Timer = TRUE,
  ModelSizeReg = 0.5,
  FeatureBorderType = "GreedyLogSum",
  SamplingUnit = "Group",
  SubSample = NULL,
  ScoreFunction = "Cosine",
  MinDataInLeaf = 1
)
```

Arguments

`data` Supply your full series data set here

`TimeWeights` Supply a value that will be multiplied by he time trend value

`NonNegativePred` TRUE or FALSE

`RoundPreds` Rounding predictions to an integer value. TRUE or FALSE. Defaults to FALSE

`TrainOnFull` Set to TRUE to train on full data

`TargetColumnName` List the column name of your target variables column. E.g. "Target"

`DateColumnName` List the column name of your date column. E.g. "DateTime"

`HierarchGroups` Vector of hierachy categorical columns.

`GroupVariables` Defaults to NULL. Use NULL when you have a single series. Add in GroupVariables when you have a series for every level of a group or multiple groups.

`FC_Periods` Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead

`TimeUnit` List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".

`TimeGroups` Select time aggregations for adding various time aggregated GDL features.

`PDFOutputPath` NULL or a path file to output PDFs to a specified folder

`SaveDataPath` NULL Or supply a path. Data saved will be called 'ModelID'_data.csv

`NumOfParDepPlots` Supply a number for the number of partial dependence plots you want returned

`TargetTransformation` TRUE or FALSE. If TRUE, select the methods in the Methods arg you want tested. The best one will be applied.

`Methods` Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.

`AnomalyDetection` NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, "tstat_low" = -4)

`XREGS` Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

`Lags` Select the periods for all lag variables you want to create. E.g. c(1:5,52) or list("day" = c(1:10), "weeks" = c(1:4))

`MA_Periods` Select the periods for all moving average variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`SD_Periods` Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Skew_Periods` Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Kurt_Periods` Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Quantile_Periods`
: Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Quantiles_Selected`
: Select from the following "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"

`Difference`
: Puts the I in ARIMA for single series and grouped series.

`FourierTerms`
: Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interations if hierarchy is enabled.

`CalendarVariables`
: NULL, or select from "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

`HolidayVariable`
: NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

`HolidayLookback`
: Number of days in range to compute number of holidays from a given date in the data. If NULL, the number of days are computed for you.

`HolidayLags`
: Number of lags to build off of the holiday count variable.

`HolidayMovingAverages`
: Number of moving averages to build off of the holiday count variable.

`TimeTrendVariable`
: Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

`ZeroPadSeries`
: NULL to do nothing. Otherwise, set to "maxmax", "minmax", "maxmin", "minmin". See `TimeSeriesFill` for explanations of each type

`DataTruncate`
: Set to TRUE to remove records with missing values from the lags and moving average features created

`SplitRatios`
: E.g c(0.7,0.2,0.1) for train, validation, and test sets

`PartitionType`
: Select "random" for random data partitioning "timeseries" for partitioning by time frames

`TaskType`
: Default is "GPU" but you can also set it to "CPU"

`NumGPU`
: Defaults to 1. If CPU is set this argument will be ignored.

`DebugMode`
: Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

`EvalMetric`
: Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"

`EvalMetricValue`
: Used when EvalMetric accepts an argument. See `AutoCatBoostRegression`

`LossFunction`
: Used in model training for model fitting. Select from 'RMSE', 'MAE', 'Quantile', 'LogLinQuantile', 'MAPE', 'Poisson', 'PairLogitPairwise', 'Tweedie', 'QueryRMSE'

`LossFunctionValue`
: Used when LossFunction accepts an argument. See `AutoCatBoostRegression`

`GridTune`
: Set to TRUE to run a grid tune

`PassInGrid`
: Defaults to NULL

`ModelCount` Set the number of models to try in the grid tune

`MaxRunsWithoutNewWinner` Default is 50

`MaxRunMinutes` Default is 60*60

`Langevin` Enables the Stochastic Gradient Langevin Boosting mode. If TRUE and TaskType == "GPU" then TaskType will be converted to "CPU"

`DiffusionTemperature` Default is 10000

`NTrees` Select the number of trees you want to have built to train the model

`L2_Leaf_Reg` l2 reg parameter

`LearningRate` Defaults to NULL. Catboost will dynamically define this if L2_Leaf_Reg is NULL and RMSE is chosen (otherwise catboost will default it to 0.03). Then you can pull it out of the model object and pass it back in should you wish.

`RandomStrength` Default is 1

`BorderCount` Default is 254

`Depth` Depth of catboost model

`RSM` CPU only. If TaskType is GPU then RSM will not be used

`BootStrapType` If NULL, then if TaskType is GPU then Bayesian will be used. If CPU then MVS will be used. If MVS is selected when TaskType is GPU, then BootStrapType will be switched to Bayesian

`GrowPolicy` Default is SymmetricTree. Others include Lossguide and Depthwise

`Timer` Set to FALSE to turn off the updating print statements for progress

`ModelSizeReg` Defaults to 0.5. Set to 0 to allow for bigger models. This is for models with high cardinality categorical features. Valuues greater than 0 will shrink the model and quality will decline but models won't be huge.

`FeatureBorderType` Defaults to "GreedyLogSum". Other options include: Median, Uniform, UniformAndQuantiles, MaxLogSum, MinEntropy

`SamplingUnit` Default is Group. Other option is Object. if GPU is selected, this will be turned off unless the loss_function is YetiRankPairWise

`SubSample` Can use if BootStrapType is neither Bayesian nor No. Pass NULL to use Catboost default. Used for bagging.

`ScoreFunction` Default is Cosine. CPU options are Cosine and L2. GPU options are Cosine, L2, NewtonL2, and NewtomCosine (not available for Lossguide)

`MinDataInLeaf` Defaults to 1. Used if GrowPolicy is not SymmetricTree

`AutoCatBoostClassifier` *AutoCatBoostClassifier*

Description

AutoCatBoostClassifier is an automated modeling function that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train, validation, and test sets (if not supplied). Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions (on test data), an ROC plot, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting. You can download the catboost package using devtools, via: devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')

Usage

```
AutoCatBoostClassifier(
  data,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TrainOnFull = FALSE,
  task_type = "GPU",
  NumGPUs = 1,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  SaveInfoToPDF = FALSE,
  ModelID = "FirstModel",
  model_path = NULL,
  metadata_path = NULL,
  EvalMetric = "MCC",
  LossFunction = NULL,
  grid_eval_metric = "MCC",
  ClassWeights = c(1, 1),
  CostMatrixWeights = c(1, 0, 0, 1),
  NumOfParDepPlots = 0L,
```

```
  PassInGrid = NULL,
  GridTune = FALSE,
  MaxModelsInGrid = 30L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  BaselineComparison = "default",
  MetricPeriods = 10L,
  Trees = 50L,
  Depth = 6,
  LearningRate = NULL,
  L2_Leaf_Reg = 3,
  RandomStrength = 1,
  BorderCount = 128,
  RSM = NULL,
  BootStrapType = NULL,
  GrowPolicy = "SymmetricTree",
  langevin = FALSE,
  diffusion_temperature = 10000,
  model_size_reg = 0.5,
  feature_border_type = "GreedyLogSum",
  sampling_unit = "Object",
  subsample = NULL,
  score_function = "Cosine",
  min_data_in_leaf = 1,
  DebugMode = FALSE
)
```

Arguments

data	This is your data set for training and testing your model
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located, but not mixed types. Note that the target column needs to be a 0 | 1 numeric variable.
FeatureColNames	Either supply the feature column names OR the column number where the target is located, but not mixed types. Also, not zero-indexed.
PrimaryDateColumn	Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
TrainOnFull	Set to TRUE to train on full data and skip over evaluation steps
task_type	Set to "GPU" to utilize your GPU for training. Default is "CPU".
NumGPUs	Numeric. If you have 4 GPUs supply 4 as a value.

ReturnModelObjects
: Set to TRUE to output all modeling objects. E.g. plots and evaluation metrics

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

SaveInfoToPDF
: Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory

ModelID
: A character string to name your model and output

model_path
: A character string of your path file to where you want your output saved

metadata_path
: A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

EvalMetric
: This is the metric used inside catboost to measure performance on validation data during a grid-tune. "AUC" is the default. 'Logloss', 'CrossEntropy', 'Precision', 'Recall', 'F1', 'BalancedAccuracy', 'BalancedErrorRate', 'MCC', 'Accuracy', 'CtrFactor', 'AUC', 'BrierScore', 'HingeLoss', 'HammingLoss', 'ZeroOneLoss', 'Kappa', 'WKappa', 'LogLikelihoodOfPrediction', 'TotalF1', 'PairLogit', 'PairLogitPairwise', 'PairAccuracy', 'QueryCrossEntropy', 'QuerySoftMax', 'PFound', 'NDCG', 'AverageGain', 'PrecisionAt', 'RecallAt', 'MAP'

LossFunction
: Default is NULL. Select the loss function of choice. c("MultiRMSE", 'Logloss','CrossEntropy','Lq','

grid_eval_metric
: Case sensitive. I typically choose 'Utility' or 'MCC'. Choose from 'Utility', 'MCC', 'Acc', 'F1_Score', 'F2_Score', 'F0.5_Score', 'TPR', 'TNR', 'FNR', 'FPR', 'FDR', 'FOR', 'NPV', 'PPV', 'ThreatScore'

ClassWeights
: Supply a vector of weights for your target classes. E.g. c(0.25, 1) to weight your 0 class by 0.25 and your 1 class by 1.

CostMatrixWeights
: A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1)

NumOfParDepPlots
: Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

PassInGrid
: Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

MaxModelsInGrid
: Number of models to test from grid options.

MaxRunsWithoutNewWinner
: A number

MaxRunMinutes
: In minutes

BaselineComparison
: Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

MetricPeriods
: Number of trees to build before evaluating intermediate metrics. Default is 10L

Trees
: Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)

Depth	Bandit grid partitioned Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)
LearningRate	Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)
L2_Leaf_Reg	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)
RandomStrength	A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.
BorderCount	Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU
RSM	CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)
BootStrapType	Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")
GrowPolicy	Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Lossguide")
langevin	TRUE or FALSE. TRUE enables
diffusion_temperature	Default value is 10000
model_size_reg	Defaults to 0.5. Set to 0 to allow for bigger models. This is for models with high cardinality categorical features. Valuues greater than 0 will shrink the model and quality will decline but models won't be huge.
feature_border_type	Defaults to "GreedyLogSum". Other options include: Median, Uniform, UniformAndQuantiles, MaxLogSum, MinEntropy
sampling_unit	Default is Group. Other option is Object. if GPU is selected, this will be turned off unless the LossFunction is YetiRankPairWise
subsample	Default is NULL. Catboost will turn this into 0.66 for BootStrapTypes Poisson and Bernoulli. 0.80 for MVS. Doesn't apply to others.
score_function	Default is Cosine. CPU options are Cosine and L2. GPU options are Cosine, L2, NewtonL2, and NewtomCosine (not available for Lossguide)
min_data_in_leaf	Default is 1. Cannot be used with SymmetricTree is GrowPolicy
DebugMode	Set to TRUE to get a printout of which step the function is on. FALSE, otherwise

Value

Saves to file and returned in list: VariableImportance.csv, Model (the model), ValidationData.csv, ROC_Plot.png, EvalutionPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

`AutoCatBoostHurdleCARMA` *AutoCatBoostHurdleCARMA*

Description

AutoCatBoostHurdleCARMA is an intermittent demand, Mutlivariate Forecasting algorithms with calendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```
AutoCatBoostHurdleCARMA(
  data,
  NonNegativePred = FALSE,
  Threshold = NULL,
  RoundPreds = FALSE,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  DateColumnName = "DateTime",

  PartitionType = "timeseries",
  Timer = TRUE,
  DebugMode = FALSE
)
```

Arguments

`data`	Supply your full series data set here
`NonNegativePred`	TRUE or FALSE
`Threshold`	Select confusion matrix measure to optimize for pulling in threshold. Choose from "MCC", "Acc", "TPR", "TNR", "FNR", "FPR", "FDR", "FOR", "F1_Score", "F2_Score", "F0.5_Score", "NPV", "PPV", "ThreatScore", "Utility"
`RoundPreds`	Rounding predictions to an integer value. TRUE or FALSE. Defaults to FALSE
`TrainOnFull`	Set to TRUE to train on full data
`TargetColumnName`	List the column name of your target variables column. E.g. "Target"
`DateColumnName`	List the column name of your date column. E.g. "DateTime"
`HierarchGroups`	Vector of hierachy categorical columns.
`GroupVariables`	Defaults to NULL. Use NULL when you have a single series. Add in GroupVariables when you have a series for every level of a group or multiple groups.
`FC_Periods`	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
`TimeUnit`	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
`TimeGroups`	Select time aggregations for adding various time aggregated GDL features.
`NumOfParDepPlots`	Supply a number for the number of partial dependence plots you want returned
`TargetTransformation`	Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
`Methods`	Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.
`AnomalyDetection`	NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)
`XREGS`	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

Lags Select the periods for all lag variables you want to create. E.g. c(1:5,52)

MA_Periods Select the periods for all moving average variables you want to create. E.g. c(1:5,52)

SD_Periods Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)

Skew_Periods Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)

Kurt_Periods Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)

Quantile_Periods
Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)

Quantiles_Selected
Select from the following "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"

Difference Puts the I in ARIMA for single series and grouped series.

FourierTerms Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interations if hierarchy is enabled.

CalendarVariables
NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

HolidayVariable
NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

HolidayLookback
Number of days in range to compute number of holidays from a given date in the data. If NULL, the number of days are computed for you.

HolidayLags Number of lags to build off of the holiday count variable.

HolidayMovingAverages
Number of moving averages to build off of the holiday count variable.

TimeTrendVariable
Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

ZeroPadSeries Set to "all", "inner", or NULL. See TimeSeriesFill for explanation

DataTruncate Set to TRUE to remove records with missing values from the lags and moving average features created

SplitRatios E.g c(0.7,0.2,0.1) for train, validation, and test sets

TaskType Default is "GPU" but you can also set it to "CPU"

NumGPU Defaults to 1. If CPU is set this argument will be ignored.

EvalMetric Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"

GridTune Set to TRUE to run a grid tune

PassInGrid Defaults to NULL

ModelCount Set the number of models to try in the grid tune

`MaxRunsWithoutNewWinner`	Default is 50
`MaxRunMinutes`	Default is 60*60
`NTrees`	Select the number of trees you want to have built to train the model
`Depth`	Depth of catboost model
`LearningRate`	learning_rate
`L2_Leaf_Reg`	l2 reg parameter
`RandomStrength`	Default is 1
`BorderCount`	Default is 254
`BootStrapType`	Select from Catboost list
`PartitionType`	Select "random" for random data partitioning "timeseries" for partitioning by time frames
`Timer`	Set to FALSE to turn off the updating print statements for progress
`DebugMode`	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoCatBoostHurdleModel

AutoCatBoostHurdleModel

Description

AutoCatBoostHurdleModel for generalized hurdle modeling. Check out the Readme.Rd on github for more background.

Usage

```
AutoCatBoostHurdleModel(
  data = NULL,
  TimeWeights = NULL,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"),
  ClassWeights = NULL,
  SplitRatios = c(0.7, 0.2, 0.1),
  task_type = "GPU",
  ModelID = "ModelTest",
  Paths = NULL,
  MetaDataPaths = NULL,
  SaveModelObjects = FALSE,
  ReturnModelObjects = TRUE,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL,
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 1L,
  MaxRunsWithoutNewWinner = 20L,
```

```
  MaxRunMinutes = 60L * 60L,
  MetricPeriods = 25L,
  Langevin = FALSE,
  DiffusionTemperature = 10000,
  Trees = list(classifier = seq(1000, 2000, 100), regression = seq(1000, 2000, 100)),
  Depth = list(classifier = seq(6, 10, 1), regression = seq(6, 10, 1)),
  RandomStrength = list(classifier = seq(1, 10, 1), regression = seq(1, 10, 1)),
  BorderCount = list(classifier = seq(32, 256, 16), regression = seq(32, 256, 16)),
  LearningRate = list(classifier = seq(0.01, 0.25, 0.01), regression = seq(0.01, 0.25,
    0.01)),
  L2_Leaf_Reg = list(classifier = seq(3, 10, 1), regression = seq(1, 10, 1)),
  RSM = list(classifier = c(0.8, 0.85, 0.9, 0.95, 1), regression = c(0.8, 0.85, 0.9,
    0.95, 1)),
  BootStrapType = list(classifier = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),
    regression = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")),
  GrowPolicy = list(classifier = c("SymmetricTree", "Depthwise", "Lossguide"),
    regression = c("SymmetricTree", "Depthwise", "Lossguide"))
)
```

Arguments

data	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
TimeWeights	Supply a value that will be multiplied by he time trend value
TrainOnFull	Set to TRUE to use all data
ValidationData	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
TestData	Souce test data. Do not include a column that has the class labels for the buckets as they are created internally.
Buckets	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
TargetColumnName	Supply the column name or number for the target variable
FeatureColNames	Supply the column names or number of the features (not included the Primary-DateColumn)
PrimaryDateColumn	Supply a date column if the data is functionally related to it
IDcols	Includes PrimaryDateColumn and any other columns you want returned in the validation data with predictions
TransformNumericColumns	Transform numeric column inside the AutoCatBoostRegression() function
Methods	Choose transformation methods
ClassWeights	Utilize these for the classifier model
SplitRatios	Supply vector of partition ratios. For example, c(0.70,0.20,0,10).
task_type	Set to "GPU" or "CPU"
ModelID	Define a character name for your models

`Paths` The path to your folder where you want your model information saved

`MetaDataPaths` TA character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.

`SaveModelObjects` Set to TRUE to save the model objects to file in the folders listed in Paths

`ReturnModelObjects` TRUE to return the models

`NumOfParDepPlots` Set to pull back N number of partial dependence calibration plots.

`PassInGrid` Pass in a grid for changing up the parameter settings for catboost

`GridTune` Set to TRUE if you want to grid tune the models

`BaselineComparison` = "default",

`MaxModelsInGrid` = 1L,

`MaxRunsWithoutNewWinner` = 20L,

`MaxRunMinutes` = 60L*60L,

`MetricPeriods` = 25L,

`Langevin` TRUE or FALSE

`DiffusionTemperature` Default 10000

`Trees` Provide a named list to have different number of trees for each model. Trees = list("classifier" = seq(1000,2000,100), "regression" = seq(1000,2000,100))

`Depth` = seq(4L, 8L, 1L),

`RandomStrength` 1

`BorderCount` 128

`LearningRate` = seq(0.01,0.10,0.01),

`L2_Leaf_Reg` = seq(1.0, 10.0, 1.0),

`RSM` = c(0.80, 0.85, 0.90, 0.95, 1.0),

`BootStrapType` = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),

`GrowPolicy` = c("SymmetricTree", "Depthwise", "Lossguide")

`Shuffles` = 2L,

Value

Returns AutoCatBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and catboost-grid

AutoCatBoostMultiClass

AutoCatBoostMultiClass

Description

AutoCatBoostMultiClass is an automated modeling function that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, variable importance, and column names used in model fitting. You can download the catboost package using devtools, via: devtools::install_github('catboost/catboost', subdir = 'catboost/R-package').

Usage

```
AutoCatBoostMultiClass(
  data,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  PrimaryDateColumn = NULL,
  IDcols = NULL,
  TrainOnFull = FALSE,
  task_type = "GPU",
  NumGPUs = 1,
  DebugMode = FALSE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  ModelID = "FirstModel",
  model_path = NULL,
  metadata_path = NULL,
  ClassWeights = NULL,
  eval_metric = "MultiClassOneVsAll",
  loss_function = "MultiClassOneVsAll",
  grid_eval_metric = "Accuracy",
```

```
  BaselineComparison = "default",
  MetricPeriods = 10L,
  PassInGrid = NULL,
  GridTune = FALSE,
  MaxModelsInGrid = 30L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  Trees = 50L,
  Depth = 6,
  LearningRate = NULL,
  L2_Leaf_Reg = NULL,
  RandomStrength = 1,
  BorderCount = 128,
  RSM = NULL,
  BootStrapType = NULL,
  GrowPolicy = NULL,
  langevin = FALSE,
  diffusion_temperature = 10000,
  model_size_reg = 0.5,
  feature_border_type = "GreedyLogSum",
  sampling_unit = "Object",
  subsample = NULL,
  score_function = "Cosine",
  min_data_in_leaf = 1
)
```

Arguments

`data`	This is your data set for training and testing your model
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TestData`	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TargetColumnName`	Either supply the target column name OR the column number where the target is located, but not mixed types. Note that the target column needs to be a 0 | 1 numeric variable.
`FeatureColNames`	Either supply the feature column names OR the column number where the target is located, but not mixed types. Also, not zero-indexed.
`PrimaryDateColumn`	Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling
`IDcols`	A vector of column names or column numbers to keep in your data but not include in the modeling.
`TrainOnFull`	Set to TRUE to train on full data and skip over evaluation steps
`task_type`	Set to "GPU" to utilize your GPU for training. Default is "CPU".
`NumGPUs`	Set to 1, 2, 3, etc.
`DebugMode`	TRUE to print out steps taken

ReturnModelObjects
: Set to TRUE to output all modeling objects. E.g. plots and evaluation metrics

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

ModelID
: A character string to name your model and output

model_path
: A character string of your path file to where you want your output saved

metadata_path
: A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

ClassWeights
: Supply a vector of weights for your target classes. E.g. c(0.25, 1) to weight your 0 class by 0.25 and your 1 class by 1.

eval_metric
: Internal bandit metric. Select from 'MultiClass', 'MultiClassOneVsAll', 'AUC', 'TotalF1', 'MCC', 'Accuracy', 'HingeLoss', 'HammingLoss', 'ZeroOneLoss', 'Kappa', 'WKappa'

loss_function
: Select from 'MultiClass' or 'MultiClassOneVsAll'

grid_eval_metric
: For evaluating models within grid tuning. Choices include, "accuracy", "microauc", "logloss"

BaselineComparison
: Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

MetricPeriods
: Number of trees to build before evaluating intermediate metrics. Default is 10L

PassInGrid
: Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

MaxModelsInGrid
: Number of models to test from grid options.

MaxRunsWithoutNewWinner
: A number

MaxRunMinutes
: In minutes

Trees
: Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)

Depth
: Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)

LearningRate
: Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

L2_Leaf_Reg
: Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)

RandomStrength
: A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.

`BorderCount` Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU

`RSM` CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)

`BootStrapType` Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")

`GrowPolicy` Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Lossguide")

`langevin` TRUE or FALSE. Enable stochastic gradient langevin boosting

`diffusion_temperature`
Default is 10000 and is only used when langevin is set to TRUE

`model_size_reg` Defaults to 0.5. Set to 0 to allow for bigger models. This is for models with high cardinality categorical features. Valuues greater than 0 will shrink the model and quality will decline but models won't be huge.

`feature_border_type`
Defaults to "GreedyLogSum". Other options include: Median, Uniform, UniformAndQuantiles, MaxLogSum, MinEntropy

`sampling_unit` Default is Group. Other option is Object. if GPU is selected, this will be turned off unless the loss_function is YetiRankPairWise

`subsample` Default is NULL. Catboost will turn this into 0.66 for BootStrapTypes Poisson and Bernoulli. 0.80 for MVS. Doesn't apply to others.

`score_function` Default is Cosine. CPU options are Cosine and L2. GPU options are Cosine, L2, NewtonL2, and NewtomCosine (not available for Lossguide)

`min_data_in_leaf`
Default is 1. Cannot be used with SymmetricTree is GrowPolicy

Value

Saves to file and returned in list: VariableImportance.csv, Model (the model), ValidationData.csv, EvaluationMetrics.csv, GridCollect, and GridList

AutoCatBoostRegression

AutoCatBoostRegression

Description

AutoCatBoostRegression is an automated modeling function that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting. You can download the catboost package using devtools, via: devtools::install_github('catboost/catboost', subdir = 'catboost/R-package')

Usage

```
AutoCatBoostRegression(
  data,
  ValidationData = NULL,
  TestData = NULL,
  Weights = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
```

```
  PrimaryDateColumn = NULL,
  DummifyCols = FALSE,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", "Logit"),
  TrainOnFull = FALSE,
  task_type = "GPU",
  NumGPUs = 1,
  DebugMode = FALSE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  ModelID = "FirstModel",
  model_path = NULL,
  metadata_path = NULL,
  SaveInfoToPDF = FALSE,
  eval_metric = "RMSE",
  eval_metric_value = 1.5,
  loss_function = "RMSE",
  loss_function_value = 1.5,
  grid_eval_metric = "r2",
  NumOfParDepPlots = 0L,
  EvalPlots = TRUE,
  PassInGrid = NULL,
  GridTune = FALSE,
  MaxModelsInGrid = 30L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  Shuffles = 1L,
  BaselineComparison = "default",
  MetricPeriods = 10L,
  Trees = 500L,
  Depth = 9,
  L2_Leaf_Reg = 3,
  RandomStrength = 1,
  BorderCount = 254,
  LearningRate = NULL,
  RSM = 1,
  BootStrapType = NULL,
  GrowPolicy = "SymmetricTree",
  langevin = FALSE,
  diffusion_temperature = 10000,
  model_size_reg = 0.5,
  feature_border_type = "GreedyLogSum",
  sampling_unit = "Object",
  subsample = NULL,
  score_function = "Cosine",
  min_data_in_leaf = 1
)
```

Arguments

data	This is your data set for training and testing your model

ValidationData This is your holdout data set used in modeling either refine your hyperparameters. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

TestData This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

Weights Weights vector for train.pool in catboost

TargetColumnName
Either supply the target column name OR the column number where the target is located (but not mixed types).

FeatureColNames
Either supply the feature column names OR the column number where the target is located (but not mixed types)

PrimaryDateColumn
Supply a date or datetime column for catboost to utilize time as its basis for handling categorical features, instead of random shuffling

DummifyCols Logical. Will coerce to TRUE if loss_function or eval_metric is set to 'MultiRMSE'.

IDcols A vector of column names or column numbers to keep in your data but not include in the modeling.

TransformNumericColumns
Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed

Methods Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.

TrainOnFull Set to TRUE to train on full data and skip over evaluation steps

task_type Set to "GPU" to utilize your GPU for training. Default is "CPU".

NumGPUs Set to 1, 2, 3, etc.

DebugMode Set to TRUE to get a printout of which step the function is on. FALSE, otherwise

ReturnModelObjects
Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects
Set to TRUE to return all modeling objects to your environment

ModelID A character string to name your model and output

model_path A character string of your path file to where you want your output saved

metadata_path A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

SaveInfoToPDF Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory

eval_metric Select from 'RMSE', 'MAE', 'MAPE', 'R2', 'Poisson', 'MedianAbsoluteError', 'SMAPE', 'MSLE', 'NumErrors', 'FairLoss', 'Tweedie', 'Huber', 'LogLinQuantile', 'Quantile', 'Lq', 'Expectile', 'MultiRMSE'

eval_metric_value
Used with the specified eval_metric. See https://catboost.ai/docs/concepts/loss-functions-regression.html

`loss_function` Used in model training for model fitting. 'MAPE', 'MAE', 'RMSE', 'Poisson', 'Tweedie', 'Huber', 'LogLinQuantile', 'Quantile', 'Lq', 'Expectile', 'MultiRMSE'

`loss_function_value`
Used with the specified loss function if an associated value is required. 'Tweedie', 'Huber', 'LogLinQuantile', 'Quantile' 'Lq', 'Expectile'. See https://catboost.ai/docs/concepts/loss-functions-regression.html

`grid_eval_metric`
Choose from "mae", "mape", "rmse", "r2". Case sensitive

`NumOfParDepPlots`
Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

`EvalPlots` Defaults to TRUE. Set to FALSE to not generate and return these objects.

`PassInGrid` Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)

`GridTune` Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

`MaxModelsInGrid`
Number of models to test from grid options

`MaxRunsWithoutNewWinner`
Number of models built before calling it quits

`MaxRunMinutes` Maximum number of minutes to let this run

`Shuffles` Number of times to randomize grid possibilities

`BaselineComparison`
Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

`MetricPeriods` Number of periods to use between Catboost evaluations

`Trees` Standard + Grid Tuning. Bandit grid partitioned. The maximum number of trees you want in your models

`Depth` Standard + Grid Tuning. Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)

`L2_Leaf_Reg` Standard + Grid Tuning. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)

`RandomStrength` Standard + Grid Tuning. A multiplier of randomness added to split evaluations. Default value is 1 which adds no randomness.

`BorderCount` Standard + Grid Tuning. Number of splits for numerical features. Catboost defaults to 254 for CPU and 128 for GPU

`LearningRate` Standard + Grid Tuning. Default varies if RMSE, MultiClass, or Logloss is utilized. Otherwise default is 0.03. Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

RSM
: CPU only. Standard + Grid Tuning. If GPU is set, this is turned off. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)

BootStrapType
: Standard + Grid Tuning. NULL value to default to catboost default (Bayesian for GPU and MVS for CPU). Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")

GrowPolicy
: Standard + Grid Tuning. Catboost default of SymmetricTree. Random testing. Default "SymmetricTree", character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Lossguide")

langevin
: Set to TRUE to enable

diffusion_temperature
: Defaults to 10000

model_size_reg
: Defaults to 0.5. Set to 0 to allow for bigger models. This is for models with high cardinality categorical features. Valuues greater than 0 will shrink the model and quality will decline but models won't be huge.

feature_border_type
: Defaults to "GreedyLogSum". Other options include: Median, Uniform, UniformAndQuantiles, MaxLogSum, MinEntropy

sampling_unit
: Default is Group. Other option is Object. if GPU is selected, this will be turned off unless the loss_function is YetiRankPairWise

subsample
: Default is NULL. Catboost will turn this into 0.66 for BootStrapTypes Poisson and Bernoulli. 0.80 for MVS. Doesn't apply to others.

score_function
: Default is Cosine. CPU options are Cosine and L2. GPU options are Cosine, L2, NewtonL2, and NewtomCosine (not available for Lossguide)

min_data_in_leaf
: Default is 1. Cannot be used with SymmetricTree is GrowPolicy

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, catboostgrid, and a transformation details file.

`AutoCatBoostScoring` *AutoCatBoostScoring*

Description

AutoCatBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions. This function requires you to supply features for scoring. It will run ModelDataPrep() to prepare your features for catboost data conversion and scoring.

Usage

```
AutoCatBoostScoring(
  TargetType = NULL,
  ScoringData = NULL,
  FeatureColumnNames = NULL,
  FactorLevelsList = NULL,
  IDcols = NULL,
  OneHot = FALSE,
  ReturnShapValues = FALSE,
  ModelObject = NULL,
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  MultiClassTargetLevels = NULL,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = FALSE,
  MDP_CharToFactor = FALSE,
  MDP_RemoveDates = FALSE,
  MDP_MissFactor = "0",
  MDP_MissNum = -1,
  RemoveModel = FALSE
)
```

Arguments

`TargetType` Set this value to "regression", "classification", "multiclass", or "multiregression" to score models built using AutoCatBoostRegression(), AutoCatBoostClassify() or AutoCatBoostMultiClass().

`ScoringData` This is your data.table of features for scoring. Can be a single row or batch.

`FeatureColumnNames` Supply either column names or column numbers used in the AutoCatBoostRegression() function

`FactorLevelsList` List of factors levels to DummifyDT()

`IDcols` Supply ID column numbers for any metadata you want returned with your predicted values

`OneHot` Passsed to DummifyD

`ReturnShapValues` Set to TRUE to return a data.table of feature contributions to all predicted values generated

`ModelObject` Supply the model object directly for scoring instead of loading it from file. If you supply this, ModelID and ModelPath will be ignored.

`ModelPath` Supply your path file used in the AutoCatBoost__() function

`ModelID` Supply the model ID used in the AutoCatBoost__() function

`ReturnFeatures` Set to TRUE to return your features with the predicted values.

MultiClassTargetLevels
: For use with AutoCatBoostMultiClass(). If you saved model objects then this scoring function will locate the target levels file. If you did not save model objects, you can supply the target levels returned from AutoCatBoostMultiClass().

TransformNumeric
: Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.

BackTransNumeric
: Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.

TargetColumnName
: Input your target column name used in training if you are utilizing the transformation service

TransformationObject
: Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file.

TransID
: Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().

TransPath
: Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.

MDP_Impute
: Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function

MDP_CharToFactor
: Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function

MDP_RemoveDates
: Set to TRUE if you have date of timestamp columns in your ScoringData

MDP_MissFactor
: If you set MDP_Impute to TRUE, supply the character values to replace missing values with

MDP_MissNum
: If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with

RemoveModel
: Set to TRUE if you want the model removed immediately after scoring

Value

A data.table of predicted values with the option to return model features as well.

AutoCatBoostVectorCARMA

AutoCatBoostVectorCARMA

Description

AutoCatBoostVectorCARMA Multiple Regression, Mutlivariate Forecasting with calendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```
AutoCatBoostVectorCARMA(

  Depth = 6,
  BootStrapType = c("Bayesian", "Bernoulli", "Poisson", "MVS", "No"),
  PartitionType = "timeseries",
  Timer = TRUE,
  DebugMode = FALSE
)
```

Arguments

`data`	Supply your full series data set here
`TimeWeights`	NULL or a value.
`NonNegativePred`	TRUE or FALSE
`RoundPreds`	Rounding predictions to an integer value. TRUE or FALSE. Defaults to FALSE
`TrainOnFull`	Set to TRUE to train on full data
`TargetColumnName`	List the column names of your target variables column. E.g. c("Target1","Target2", ..., "TargetN")
`DateColumnName`	List the column name of your date column. E.g. "DateTime"
`HierarchGroups`	Vector of hierachy categorical columns.
`GroupVariables`	Defaults to NULL. Use NULL when you have a single series. Add in GroupVariables when you have a series for every level of a group or multiple groups.
`FC_Periods`	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
`TimeUnit`	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".

TimeGroups
: Select time aggregations for adding various time aggregated GDL features.

NumOfParDepPlots
: Supply a number for the number of partial dependence plots you want returned

TargetTransformation
: Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).

Methods
: Transformation options to test which include "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"

AnomalyDetection
: NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)

XREGS
: Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

Lags
: Select the periods for all lag variables you want to create. E.g. c(1:5,52)

MA_Periods
: Select the periods for all moving average variables you want to create. E.g. c(1:5,52)

SD_Periods
: Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52)

Skew_Periods
: Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52)

Kurt_Periods
: Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52)

Quantile_Periods
: Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52)

Quantiles_Selected
: Select from the following "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"

Difference
: Puts the I in ARIMA for single series and grouped series.

FourierTerms
: Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interations if hierarchy is enabled.

CalendarVariables
: NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

HolidayVariable
: NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

HolidayLookback
: Number of days in range to compute number of holidays from a given date in the data. If NULL, the number of days are computed for you.

HolidayLags
: Number of lags to build off of the holiday count variable.

HolidayMovingAverages
: Number of moving averages to build off of the holiday count variable.

TimeTrendVariable
: Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

`ZeroPadSeries` Set to "all", "inner", or NULL. See TimeSeriesFill for explanation

`DataTruncate` Set to TRUE to remove records with missing values from the lags and moving average features created

`SplitRatios` E.g c(0.7,0.2,0.1) for train, validation, and test sets

`TaskType` Has to CPU for now. If catboost makes GPU available for "MultiRMSE" then it will be enabled. If you set to GPU the function will coerce it back to CPU.

`NumGPU` Defaults to 1. If CPU is set this argument will be ignored.

`EvalMetric` "MultiRMSE" only. If catboost updates this I'll add more later

`EvalMetricValue` Placeholder for later

`LossFunction` "MultiRMSE" only. If catboost updates this I'll add more later

`LossFunctionValue` Placeholder for later

`GridTune` Set to TRUE to run a grid tune

`PassInGrid` Defaults to NULL

`ModelCount` Set the number of models to try in the grid tune

`MaxRunsWithoutNewWinner` Default is 50

`MaxRunMinutes` Default is 60*60

`Langevin` TRUE or FALSE

`DiffusionTemperature` Default value of 10000

`NTrees` Select the number of trees you want to have built to train the model

`L2_Leaf_Reg` l2 reg parameter

`RandomStrength` Default is 1

`BorderCount` Default is 254

`Depth` Depth of catboost model

`BootStrapType` Select from Catboost list

`PartitionType` Select "random" for random data partitioning "timeseries" for partitioning by time frames

`Timer` Set to FALSE to turn off the updating print statements for progress

`DebugMode` Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function

Value

Returns a data.table of original series and forecasts, the catboost model objects (everything returned from AutoCatBoostRegression()), a time series forecast plot, and transformation info if you set TargetTransformation to TRUE. The time series forecast plot will plot your single series or aggregate your data to a single series and create a plot from that.

AutoClustering *AutoClustering*

Description

AutoClustering adds a column to your original data with a cluster number identifier. You can run request an autoencoder to be built to reduce the dimensionality of your data before running the clusering algo.

Usage

```
AutoClustering(
  data,
  FeatureColumns = NULL,
  ModelID = "TestModel",
  SavePath = NULL,
  NThreads = 8,
  MaxMemory = "28G",
  MaxClusters = 50,
  ClusterMetric = "totss",
  RunDimReduction = TRUE,
  ShrinkRate = (sqrt(5) - 1)/2,
  Epochs = 5L,
  L2_Reg = 0.1,
  ElasticAveraging = TRUE,
  ElasticAveragingMovingRate = 0.9,
  ElasticAveragingRegularization = 0.001
)
```

Arguments

`data`	is the source time series data.table
`FeatureColumns`	Independent variables
`ModelID`	For naming the files to save
`SavePath`	Directory path for saving models
`NThreads`	set based on number of threads your machine has available
`MaxMemory`	set based on the amount of memory your machine has available
`MaxClusters`	number of factors to test out in k-means to find the optimal number
`ClusterMetric`	pick the metric to identify top model in grid tune c("totss","betweenss","withinss")
`RunDimReduction`	If TRUE, an autoencoder will be built to reduce the feature space. Otherwise, all features in FeatureColumns will be used for clustering
`ShrinkRate`	Node shrink rate for H2OAutoencoder. See that function for details.
`Epochs`	For the autoencoder
`L2_Reg`	For the autoencoder

`ElasticAveraging`
: For the autoencoder

`ElasticAveragingMovingRate`
: For the autoencoder

`ElasticAveragingRegularization`
: For the autoencoder

Value

Original data.table with added column with cluster number identifier

AutoClusteringScoring *AutoClusteringScoring*

Description

AutoClusteringScoring adds a column to your original data with a cluster number identifier. You can run request an autoencoder to be built to reduce the dimensionality of your data before running the clusering algo.

Usage

```
AutoClusteringScoring(
  data,
  FeatureColumns = NULL,
  ModelID = "TestModel",
  SavePath = NULL,
  NThreads = 8,
  MaxMemory = "28G",
  DimReduction = TRUE
)
```

Arguments

`data`	is the source time series data.table
`FeatureColumns`	Independent variables

ModelID	This is returned from the training run in the output list with element named 'model_name'. It's not identical to the ModelID used in training due to the grid tuning.
SavePath	Directory path for saving models
NThreads	set based on number of threads your machine has available
MaxMemory	set based on the amount of memory your machine has available
DimReduction	Set to TRUE if you set RunDimReduction in the training version of this function

Value

Original data.table with added column with cluster number identifier

AutoCorrAnalysis *AutoCorrAnalysis*

Description

Generate correlation analysis over a data set

Usage

```
AutoCorrAnalysis(
  data = NULL,
  CorVars = NULL,
  SkipCorVars = NULL,
  ByGroupVars = NULL,
  DataSampleRate = 0.5,
  MinRows = 30,
  KeepSignificantVars = TRUE,
  PValAdjMethod = "holm",
  RobustCalc = TRUE,
  PartialCorr = FALSE,
  BayesianCorr = FALSE
)
```

Arguments

`data`	data.table
`CorVars`	Can leave NULL or supply column names you want to analyze
`SkipCorVars`	Can leave NULL or supply column names you want to skip
`ByGroupVars`	Categorical variables to run correlation analysis by

`AutoDataDictionaries` *AutoDataDictionaries*

Description

AutoDataDictionaries is a function to return data dictionary data in table form

Usage

```
AutoDataDictionaries(
  Type = "sqlserver",
  DBConnection,
  DDType = 1L,
  Query = NULL,
  ASIS = FALSE,
  CloseChannel = TRUE
)
```

Arguments

Type	= "sqlserver" is currently the only system supported
DBConnection	This is a RODBC connection object for sql server
DDType	Select from 1 - 6 based on this article
Query	Supply a query
ASIS	Set to TRUE to pull in values without coercing types
CloseChannel	Set to TRUE to disconnect

Author(s)

Adrian Antico

See Also

Other Database: SQL_ClearTable(), SQL_DropTable(), SQL_Query_Push(), SQL_Query(), SQL_SaveTable(), SQL_Server_DBConnection()

AutoDataPartition *AutoDataPartition*

Description

This function will take your ratings matrix and model and score your data in parallel.

Usage

```
AutoDataPartition(
  data,
  NumDataSets = 3L,
  Ratios = c(0.7, 0.2, 0.1),
  PartitionType = "random",
  StratifyColumnNames = NULL,
  TimeColumnName = NULL
)
```

Arguments

`data`	Source data to do your partitioning on
`NumDataSets`	The number of total data sets you want built
`Ratios`	A vector of values for how much data each data set should get in each split. E.g. c(0.70, 0.20, 0.10)
`PartitionType`	Set to either "random", "timeseries", or "time". With "random", your data will be paritioned randomly (with stratified sampling if column names are supplied). With "timeseries", you can partition by time with a stratify option (so long as you have an equal number of records for each strata). With "time" you will have data sets generated so that the training data contains the earliest records in time, validation data the second earliest, test data the third earliest, etc.
`StratifyColumnNames`	Supply column names of categorical features to use in a stratified sampling procedure for partitioning the data. Partition type must be "random" to use this option
`TimeColumnName`	Supply a date column name or a name of a column with an ID for sorting by time such that the smallest number is the earliest in time.

Value

Returns a list of data.tables

Examples

```
# Create fake data
data <- RemixAutoML::FakeDataGenerator(
  Correlation = 0.85,
  N = 1000,
  ID = 2,
  ZIP = 0,
  AddDate = FALSE,
  Classification = FALSE,
  MultiClass = FALSE)

# Run data partitioning function
dataSets <- RemixAutoML::AutoDataPartition(
  data,
  NumDataSets = 3L,
  Ratios = c(0.70,0.20,0.10),
  PartitionType = "random",
  StratifyColumnNames = NULL,
  TimeColumnName = NULL)
```

```
# Collect data
TrainData <- dataSets$TrainData
ValidationData <- dataSets$ValidationData
TestData <- dataSets$TestData
```

AutoDiffLagN *AutoDiffLagN*

Description

AutoDiffLagN create differences for selected numerical columns

Usage

```
AutoDiffLagN(
  data,
  DateVariable = NULL,
  GroupVariables = NULL,
  DiffVariables = NULL,
  DiffDateVariables = NULL,
  DiffGroupVariables = NULL,
  NLag1 = 0L,
  NLag2 = 1L,
  Sort = FALSE,
  RemoveNA = TRUE
)
```

Arguments

`data`	Source data
`DateVariable`	Date column used for sorting
`GroupVariables`	Difference data by group
`DiffVariables`	Column names of numeric columns to difference
`DiffDateVariables`	Columns names for date variables to difference. Output is a numeric value representing the difference in days.
`DiffGroupVariables`	Column names for categorical variables to difference. If no change then the output is 'No_Change' else 'New=NEWVAL Old=OLDVAL' where NEWVAL and OLDVAL are placeholders for the actual values
`NLag1`	If the diff calc, we have column 1 - column 2. NLag1 is in reference to column 1. If you want to take the current value minus the previous weeks value, supply a zero. If you want to create a lag2 - lag4 NLag1 gets a 2.
`NLag2`	If the diff calc, we have column 1 - column 2. NLag2 is in reference to column 2. If you want to take the current value minus the previous weeks value, supply a 1. If you want to create a lag2 - lag4 NLag1 gets a 4.
`Sort`	TRUE to sort your data inside the function
`RemoveNA`	Set to TRUE to remove rows with NA generated by the lag operation

```

AutoETS *AutoETS*

Description

AutoETS is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The paramter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```
AutoETS(
  data,
  FilePath = NULL,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, min(4L, parallel::detectCores() - 2L))
)
```

Arguments

`data` Source data.table

`FilePath` NULL to return nothing. Provide a file path to save the model and xregs if available

`TargetVariableName` Name of your time series target variable

`DateColumnName` Name of your date column

`TimeAggLevel` Choose from "year", "quarter", "month", "week", "day", "hour"

`EvaluationMetric` Choose from MAE, MSE, and MAPE

`NumHoldOutPeriods` Number of time periods to use in the out of sample testing

`NumFCPeriods` Number of periods to forecast

`TrainWeighting` Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.

`MaxConsecutiveFails`
: When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attemps without a new winner before terminating the procedure.

`MaxNumberModels`
: Indicate the maximum number of models to test.

`MaxRunTimeMinutes`
: Indicate the maximum number of minutes to wait for a result.

`NumberCores`
: Default max(1L, min(4L, parallel::detectCores()-2L))

AutoH2OCARMA *AutoH2OCARMA*

Description

AutoH2OCARMA Mutlivariate Forecasting with calendar variables, Holiday counts, holiday lags, holiday moving averages, differencing, transformations, interaction-based categorical encoding using target variable and features to generate various time-based aggregated lags, moving averages, moving standard deviations, moving skewness, moving kurtosis, moving quantiles, parallelized interaction-based fourier pairs by grouping variables, and Trend Variables.

Usage

```
AutoH2OCARMA(
  AlgoType = "drf",
  ExcludeAlgos = "XGBoost",
  data,
  TrainOnFull = FALSE,
  TargetColumnName = "Target",
  PDFOutputPath = NULL,

)
```

Arguments

`AlgoType` Select from "dfr" for RandomForecast, "gbm" for gradient boosting, "glm" for generalized linear model, "automl" for H2O's AutoML algo, and "gam" for H2O's Generalized Additive Model.

`ExcludeAlgos` For use when AlgoType = "AutoML". Selections include "DRF","GLM","XGBoost","GBM","DeepL
and "Stacke-dEnsemble"

`data`	Supply your full series data set here
`TrainOnFull`	Set to TRUE to train on full data
`TargetColumnName`	List the column name of your target variables column. E.g. "Target"
`PDFOutputPath`	NULL or a path file to output PDFs to a specified folder
`SaveDataPath`	NULL Or supply a path. Data saved will be called 'ModelID'_data.csv
`WeightsColumn`	NULL
`NonNegativePred`	TRUE or FALSE
`RoundPreds`	Rounding predictions to an integer value. TRUE or FALSE. Defaults to FALSE
`DateColumnName`	List the column name of your date column. E.g. "DateTime"
`GroupVariables`	Defaults to NULL. Use NULL when you have a single series. Add in GroupVariables when you have a series for every level of a group or multiple groups.
`HierarchGroups`	Vector of hierachy categorical columns.
`TimeUnit`	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year".
`TimeGroups`	Select time aggregations for adding various time aggregated GDL features.
`FC_Periods`	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
`PartitionType`	Select "random" for random data partitioning "time" for partitioning by time frames
`MaxMem`	Set to the maximum amount of memory you want to allow for running this function. Default is "32G".
`NThreads`	Set to the number of threads you want to dedicate to this function.
`Timer`	Set to FALSE to turn off the updating print statements for progress
`DebugMode`	Defaults to FALSE. Set to TRUE to get a print statement of each high level comment in function
`TargetTransformation`	Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).
`Methods`	Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.
`XREGS`	Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.
`Lags`	Select the periods for all lag variables you want to create. E.g. c(1:5,52) or list("day" = c(1:10), "weeks" = c(1:4))
`MA_Periods`	Select the periods for all moving average variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))
`SD_Periods`	Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))
`Skew_Periods`	Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Kurt_Periods` Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Quantile_Periods` Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

`Quantiles_Selected` Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q6

`AnomalyDetection` NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)

`Difference` Puts the I in ARIMA for single series and grouped series.

`FourierTerms` Set to the max number of pairs. E.g. 2 means to generate two pairs for by each group level and interations if hierarchy is enabled.

`CalendarVariables` NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

`HolidayVariable` NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

`HolidayLookback` Number of days in range to compute number of holidays from a given date in the data. If NULL, the number of days are computed for you.

`HolidayLags` Number of lags to build off of the holiday count variable.

`HolidayMovingAverages` Number of moving averages to build off of the holiday count variable.

`TimeTrendVariable` Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

`DataTruncate` Set to TRUE to remove records with missing values from the lags and moving average features created

`ZeroPadSeries` NULL to do nothing. Otherwise, set to "maxmax", "minmax", "maxmin", "minmin". See `TimeSeriesFill` for explanations of each type

`SplitRatios` E.g c(0.7,0.2,0.1) for train, validation, and test sets

`EvalMetric` Select from "RMSE", "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "SMAPE", "R2", "MSLE", "MedianAbsoluteError"

`NumOfParDepPlots` Set to zeros if you do not want any returned. Can set to a very large value and it will adjust to the max number of features if it's too high

`GridTune` Set to TRUE to run a grid tune

`ModelCount` Set the number of models to try in the grid tune

`NTrees` Select the number of trees you want to have built to train the model

`LearnRate` Default 0.10, models available include gbm

`LearnRateAnnealing` Default 1, models available include gbm

`GridStrategy` Default "Cartesian", models available include

- `MaxRunTimeSecs` Default 60*60*24, models available include
- `StoppingRounds` Default 10, models available include
- `MaxDepth` Default 20, models available include drf, gbm
- `SampleRate` Default 0.632, models available include drf, gbm
- `MTries` Default 1, models available include drf
- `ColSampleRate` Default 1, model available include gbm
- `ColSampleRatePerTree` Default 1, models available include drf, gbm
- `ColSampleRatePerTreeLevel` Default 1, models available include drf, gbm
- `MinRows` Default 1, models available include drf, gbm
- `NBins` Default 20, models available include drf, gbm
- `NBinsCats` Default 1024, models available include drf, gbm
- `NBinsTopLevel` Default 1024, models available include drf, gbm
- `CategoricalEncoding` Default "AUTO". Choices include : "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited"
- `HistogramType` Default "AUTO". Select from "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin"
- `Distribution` Model family
- `Link` Link for model family
- `RandomDistribution` Default NULL
- `RandomLink` Default NULL
- `Solver` Model optimizer
- `Alpha` Default NULL
- `Lambda` Default NULL
- `LambdaSearch` Default FALSE,
- `NLambdas` Default -1
- `Standardize` Default TRUE
- `RemoveCollinearColumns` Default FALSE
- `InterceptInclude` Default TRUE
- `NonNegativeCoefficients` Default FALSE
- `RandomColNumbers` NULL
- `InteractionColNumbers` NULL

`AutoH2oDRFClassifier` *AutoH2oDRFClassifier*

Description

AutoH2oDRFClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

Usage

```
AutoH2oDRFClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  WeightsColumn = NULL,
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
     intern = TRUE))/1e+06)), "G") },
  NThreads = max(1L, parallel::detectCores() - 2L),
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  SaveInfoToPDF = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = FALSE,
  H2OStartUp = TRUE,
  GridTune = FALSE,
  GridStrategy = "RandomDiscrete",
  MaxRunTimeSecs = 60 * 60 * 24,
  StoppingRounds = 10,
  MaxModelsInGrid = 2,
  DebugMode = FALSE,
  eval_metric = "auc",
  CostMatrixWeights = c(1, 0, 0, 1),
  Trees = 50L,
  MaxDepth = 20L,
  SampleRate = 0.632,
  MTries = -1,
  ColSampleRatePerTree = 1,
  ColSampleRatePerTreeLevel = 1,
  MinRows = 1,
  NBins = 20,
  NBinsCats = 1024,
  NBinsTopLevel = 1024,
  HistogramType = "AUTO",
  CategoricalEncoding = "AUTO"
)
```

Arguments

`data` This is your data set for training and testing your model

TrainOnFull Set to TRUE to train on full data

ValidationData This is your holdout data set used in modeling either refine your hyperparameters.

TestData This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

TargetColumnName
Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 | 1 numeric variable.

FeatureColNames
Either supply the feature column names OR the column number where the target is located (but not mixed types)

WeightsColumn Column name of a weights column

MaxMem Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"

NThreads Set the number of threads you want to dedicate to the model building

model_path A character string of your path file to where you want your output saved

metadata_path A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

ModelID A character string to name your model and output

NumOfParDepPlots
Tell the function the number of partial dependence calibration plots you want to create.

ReturnModelObjects
Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects
Set to TRUE to return all modeling objects to your environment

SaveInfoToPDF Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory

IfSaveModel Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

H2OShutdown Set to TRUE to shutdown H2O after running the function

H2OStartUp Defaults to TRUE which means H2O will be started inside the function

GridTune Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy Default "Cartesian"

MaxRunTimeSecs Default 86400

StoppingRounds Default 10

MaxModelsInGrid
Number of models to test from grid options (1080 total possible options)

DebugMode Set to TRUE to get a printout of each step taken internally

eval_metric This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"

CostMatrixWeights
A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1),

`Trees`	The maximum number of trees you want in your models
`MaxDepth`	Default 20
`SampleRate`	Default 0.632
`MTries`	Default -1 means it will default to number of features divided by 3
`ColSampleRatePerTree`	Default 1
`ColSampleRatePerTreeLevel`	Default 1
`MinRows`	Default 1
`NBinsCats`	Default 1024
`NBinsTopLevel`	Default 1024
`HistogramType`	Default "AUTO"
`CategoricalEncoding`	Default "AUTO"

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evalution-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

`AutoH2oDRFHurdleModel` *AutoH2oDRFHurdleModel*

Description

AutoH2oDRFHurdleModel for hurdle modeling

Usage

```
AutoH2oDRFHurdleModel(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  TransformNumericColumns = NULL,
  SplitRatios = c(0.7, 0.2, 0.1),
  ModelID = "ModelTest",
  Paths = NULL,
  MetaDataPaths = NULL,
  SaveModelObjects = TRUE,
  IfSaveModel = "mojo",
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
    intern = TRUE))/1e+06)), "G") },
  NThreads = max(1L, parallel::detectCores() - 2L),
  Trees = 1000L,
  GridTune = TRUE,
  MaxModelsInGrid = 1L,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL
)
```

Arguments

`data`	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
`TestData`	Souce test data. Do not include a column that has the class labels for the buckets as they are created internally.
`Buckets`	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
`TargetColumnName`	Supply the column name or number for the target variable
`FeatureColNames`	Supply the column names or number of the features (not included the Primary-DateColumn)
`TransformNumericColumns`	Transform numeric column inside the AutoCatBoostRegression() function
`SplitRatios`	Supply vector of partition ratios. For example, c(0.70,0.20,0,10).
`ModelID`	Define a character name for your models
`Paths`	The path to your folder where you want your model information saved

`MetaDataPaths` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.

`SaveModelObjects` Set to TRUE to save the model objects to file in the folders listed in Paths

`IfSaveModel` Save as "mojo" or "standard"

`MaxMem` Set the maximum memory your system can provide

`NThreads` Set the number of threads you want to dedicate to the model building

`Trees` Default 1000

`GridTune` Set to TRUE if you want to grid tune the models

`MaxModelsInGrid` Set to a numeric value for the number of models to try in grid tune

`NumOfParDepPlots` Set to pull back N number of partial dependence calibration plots.

`PassInGrid` Pass in a grid for changing up the parameter settings for catboost

Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoH2oDRFMultiClass *AutoH2oDRFMultiClass*

Description

AutoH2oDRFMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, confusion matrix, and variable importance.

Usage

```
AutoH2oDRFMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  WeightsColumn = NULL,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
    intern = TRUE))/1e+06)), "G") },
  NThreads = max(1, parallel::detectCores() - 2),
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  H2OShutdown = FALSE,
  H2OStartUp = TRUE,
  DebugMode = FALSE,
  eval_metric = "logloss",
  GridTune = FALSE,
  GridStrategy = "RandomDiscrete",
  MaxRunTimeSecs = 60 * 60 * 24,
  StoppingRounds = 10,
  MaxModelsInGrid = 2,
  Trees = 50,
  MaxDepth = 20L,
  SampleRate = 0.632,
```

```
  MTries = -1,
  ColSampleRatePerTree = 1,
  ColSampleRatePerTreeLevel = 1,
  MinRows = 1,
  NBins = 20,
  NBinsCats = 1024,
  NBinsTopLevel = 1024,
  HistogramType = "AUTO",
  CategoricalEncoding = "AUTO"
)
```

Arguments

`data`	This is your data set for training and testing your model
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters.
`TestData`	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TargetColumnName`	Either supply the target column name OR the column number where the target is located (but not mixed types).
`FeatureColNames`	Either supply the feature column names OR the column number where the target is located (but not mixed types)
`WeightsColumn`	Column name of a weights column
`ReturnModelObjects`	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
`SaveModelObjects`	Set to TRUE to return all modeling objects to your environment
`IfSaveModel`	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
`MaxMem`	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
`NThreads`	Set the number of threads you want to dedicate to the model building
`model_path`	A character string of your path file to where you want your output saved
`metadata_path`	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
`ModelID`	A character string to name your model and output
`H2OShutdown`	Set to TRUE to have H2O shutdown after running this function
`H2OStartUp`	Defaults to TRUE which means H2O will be started inside the function
`DebugMode`	Set to TRUE to print steps to screen
`eval_metric`	This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"
`GridTune`	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

`GridStrategy`	Default "Cartesian"
`MaxRunTimeSecs`	Default 86400
`StoppingRounds`	Default 10
`MaxModelsInGrid`	Number of models to test from grid options (1080 total possible options)
`Trees`	The maximum number of trees you want in your models
`MaxDepth`	Default 20
`SampleRate`	Default 0.632
`MTries`	Default -1 means it will default to number of features divided by 3
`ColSampleRatePerTree`	Default 1
`ColSampleRatePerTreeLevel`	Default 1
`MinRows`	Default 1
`NBins`	Default 20
`NBinsCats`	Default 1024
`NBinsTopLevel`	Default 1024
`HistogramType`	Default "AUTO"
`CategoricalEncoding`	Default "AUTO"

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvaluationMetrics.csv, GridCollect, and GridList

  ColSampleRatePerTree = 1,
  ColSampleRatePerTreeLevel = 1,
  MinRows = 1,
  NBins = 20,
  NBinsCats = 1024,
  NBinsTopLevel = 1024,
  HistogramType = "AUTO",
  CategoricalEncoding = "AUTO"
)
```

Arguments

`data` This is your data set for training and testing your model

TrainOnFull
: Set to TRUE to train on full data

ValidationData
: This is your holdout data set used in modeling either refine your hyperparameters.

TestData
: This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

TargetColumnName
: Either supply the target column name OR the column number where the target is located (but not mixed types).

FeatureColNames
: Either supply the feature column names OR the column number where the target is located (but not mixed types)

WeightsColumn
: Column name of a weights column

MaxMem
: Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"

NThreads
: Set the number of threads you want to dedicate to the model building

H2OShutdown
: Set to TRUE to shutdown H2O inside the function

H2OStartUp
: Defaults to TRUE which means H2O will be started inside the function

DebugMode
: Set to TRUE to print steps to screen

ReturnModelObjects
: Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

SaveInfoToPDF
: Set to TRUE to save insights to PDF

IfSaveModel
: Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

model_path
: A character string of your path file to where you want your output saved

metadata_path
: A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

ModelID
: A character string to name your model and output

TransformNumericColumns
: Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed

Methods
: Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.

NumOfParDepPlots
: Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

eval_metric
: This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy
: Default "Cartesian"

MaxRunTimeSecs Default 86400

StoppingRounds Default 10

MaxModelsInGrid
: Number of models to test from grid options (1080 total possible options)

Trees The maximum number of trees you want in your models

MaxDepth Default 20

SampleRate Default 0.632

MTries Default -1 means it will default to number of features divided by 3

ColSampleRatePerTree
: Default 1

ColSampleRatePerTreeLevel
: Default 1

MinRows Default 1

NBins Default 20

NBinsCats Default 1024

NBinsTopLevel Default 1024

HistogramType Default "AUTO". Select from AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin"

CategoricalEncoding
: Default "AUTO"

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

  LambdaSearch = FALSE,
  NLambdas = -1,
  Standardize = TRUE,
  RemoveCollinearColumns = FALSE,
  InterceptInclude = TRUE,
  NonNegativeCoefficients = FALSE
)
```

Arguments

`data` This is your data set for training and testing your model

`TrainOnFull` Set to TRUE to train on full data

`ValidationData` This is your holdout data set used in modeling either refine your hyperparameters.

`TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

`TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 | 1 numeric variable.

`FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)

`WeightsColumn` Weighted classification

`GamColNames` GAM column names. Up to 9 features

`Distribution` "binomial", "quasibinomial"

`Link` identity, logit, log, inverse, tweedie

`eval_metric` This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"

`CostMatrixWeights` A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1),

`MaxMem` Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"

`NThreads` Set the number of threads you want to dedicate to the model building

`model_path` A character string of your path file to where you want your output saved

`metadata_path` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

`ModelID` A character string to name your model and output

`NumOfParDepPlots` Tell the function the number of partial dependence calibration plots you want to create.

`ReturnModelObjects` Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

`SaveModelObjects`
: Set to TRUE to return all modeling objects to your environment

`SaveInfoToPDF`
: Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory

`IfSaveModel`
: Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

`H2OShutdown`
: Set to TRUE to shutdown H2O after running the function

`H2OStartUp`
: Set to TRUE to start up H2O inside function

`DebugMode`
: Set to TRUE to get a print out of steps taken internally

`GridTune`
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

`GridStrategy`
: "RandomDiscrete" or "Cartesian"

`StoppingRounds`
: Iterations in grid tuning

`MaxRunTimeSecs`
: Max run time in seconds

`MaxModelsInGrid`
: Number of models to test from grid options (1080 total possible options)

`num_knots`
: Numeric values for gam

`keep_gam_cols`
: Logical

`Solver`
: Default "AUTO". Options include "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR

`Alpha`
: Gridable. Default 0.5 Otherwise supply a value between 0 and 1. 1 is equivalent to Lasso regression. 0 is equivalent to Ridge regression. Inbetween for a blend of the two.

`Lambda`
: Gridable. Default NULL. Regularization strength.

`LambdaSearch`
: Default FALSE.

`NLambdas`
: Default -1

`Standardize`
: Default TRUE. Standardize numerical columns

`RemoveCollinearColumns`
: Default FALSE. Removes some of the linearly dependent columns

`InterceptInclude`
: Default TRUE

`NonNegativeCoefficients`
: Default FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

  Alpha = 0.5,
  Lambda = NULL,
  LambdaSearch = FALSE,
  NLambdas = -1,
  Standardize = TRUE,
  RemoveCollinearColumns = FALSE,
  InterceptInclude = TRUE,
  NonNegativeCoefficients = FALSE
)
```

Arguments

`data`	This is your data set for training and testing your model
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters.
`TestData`	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TargetColumnName`	Either supply the target column name OR the column number where the target is located (but not mixed types).
`FeatureColNames`	Either supply the feature column names OR the column number where the target is located (but not mixed types)
`WeightsColumn`	Weighted classification
`GamColNames`	GAM column names. Up to 9 features
`eval_metric`	This is the metric used to identify best grid tuned model. Choose from "logloss", "r2", "RMSE", "MSE"
`MaxMem`	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
`NThreads`	Set the number of threads you want to dedicate to the model building
`model_path`	A character string of your path file to where you want your output saved
`metadata_path`	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
`ModelID`	A character string to name your model and output
`ReturnModelObjects`	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

IfSaveModel
: Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

H2OShutdown
: Set to TRUE to have H2O shutdown after running this function

H2OStartUp
: Set to TRUE to start up H2O inside function

DebugMode
: Set to TRUE to print steps to screen

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy
: "RandomDiscrete" or "Cartesian"

StoppingRounds
: Iterations in grid tuning

MaxRunTimeSecs
: Max run time in seconds

MaxModelsInGrid
: Number of models to test from grid options (1080 total possible options)

num_knots
: Numeric values for gam

keep_gam_cols
: Logical

Solver
: Default "AUTO". Options include "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR

Alpha
: Gridable. Default 0.5 Otherwise supply a value between 0 and 1. 1 is equivalent to Lasso regression. 0 is equivalent to Ridge regression. Inbetween for a blend of the two.

Lambda
: Gridable. Default NULL. Regularization strength.

LambdaSearch
: Default FALSE.

NLambdas
: Default -1

Standardize
: Default TRUE. Standardize numerical columns

RemoveCollinearColumns
: Default FALSE. Removes some of the linearly dependent columns

InterceptInclude
: Default TRUE

NonNegativeCoefficients
: Default FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evaluation-Metrics.csv, GridCollect, and GridList

AutoH2oGAMRegression *AutoH2oGAMRegression*

Description

AutoH2oGAMRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoH2oGAMRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  InteractionColNumbers = NULL,
  WeightsColumn = NULL,
  GamColNames = NULL,
  Distribution = "gaussian",
  Link = "identity",
  TweedieLinkPower = NULL,
  TweedieVariancePower = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", "Logit"),
  eval_metric = "RMSE",
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
     intern = TRUE))/1e+06)), "G") },
  NThreads = max(1, parallel::detectCores() - 2),
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  SaveInfoToPDF = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = TRUE,
  H2OStartUp = TRUE,
  GridTune = FALSE,
  GridStrategy = "Cartesian",
```

```
  StoppingRounds = 10,
  MaxRunTimeSecs = 3600 * 24 * 7,
  MaxModelsInGrid = 2,
  num_knots = NULL,
  keep_gam_cols = TRUE,
  Solver = "AUTO",
  Alpha = 0.5,
  Lambda = NULL,
  LambdaSearch = FALSE,
  NLambdas = -1,
  Standardize = TRUE,
  RemoveCollinearColumns = FALSE,
  InterceptInclude = TRUE,
  NonNegativeCoefficients = FALSE,
  DebugMode = FALSE
)
```

Arguments

`data`	This is your data set for training and testing your model
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters.
`TestData`	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TargetColumnName`	Either supply the target column name OR the column number where the target is located (but not mixed types).
`FeatureColNames`	Either supply the feature column names OR the column number where the target is located (but not mixed types)
`InteractionColNumbers`	Column numbers of the features you want to be pairwise interacted
`WeightsColumn`	Column name of a weights column
`GamColNames`	GAM column names. Up to 9 features
`Distribution`	: "AUTO", "gaussian", "binomial", "quasi-binomial", "ordinal", "multinomial", "poisson", "gamma", "tweedie", "negative-binomial", "fractionalbinomial"
`Link`	"family_default", "identity", "logit", "log", "inverse", "tweedie","ologit"
`TweedieLinkPower`	See h2o docs for background
`TweedieVariancePower`	See h2o docs for background
`TransformNumericColumns`	Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
`Methods`	Choose from "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.

eval_metric — This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"

MaxMem — Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"

NThreads — Set the number of threads you want to dedicate to the model building

model_path — A character string of your path file to where you want your output saved

metadata_path — A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

ModelID — A character string to name your model and output

NumOfParDepPlots — Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

ReturnModelObjects — Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects — Set to TRUE to return all modeling objects to your environment

SaveInfoToPDF — Set to TRUE to save insights to PDF

IfSaveModel — Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

H2OShutdown — Set to TRUE to shutdown H2O inside the function

H2OStartUp — Defaults to TRUE which means H2O will be started inside the function

GridTune — Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy — "RandomDiscrete" or "Cartesian"

StoppingRounds — Iterations in grid tuning

MaxRunTimeSecs — Max run time in seconds

MaxModelsInGrid — Number of models to test from grid options (1080 total possible options)

num_knots — Numeric values for gam

keep_gam_cols — Logical

Solver — Default "AUTO". Options include "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR

Alpha — Gridable. Default 0.5 Otherwise supply a value between 0 and 1. 1 is equivalent to Lasso regression. 0 is equivalent to Ridge regression. Inbetween for a blend of the two.

Lambda — Gridable. Default NULL. Regularization strength.

LambdaSearch — Default FALSE.

NLambdas — Default -1

Standardize — Default TRUE. Standardize numerical columns

RemoveCollinearColumns — Default FALSE. Removes some of the linearly dependent columns

InterceptInclude — Default TRUE

NonNegativeCoefficients — Default FALSE

DebugMode — Set to TRUE to get a printout of steps taken

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

  NBins = 20,
  NBinsCats = 1024,
  NBinsTopLevel = 1024,
  HistogramType = "AUTO",
  CategoricalEncoding = "AUTO"
)
```

Arguments

`data`	This is your data set for training and testing your model
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters.

- `TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
- `TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types).
- `FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)
- `WeightsColumn` Column name of a weights column
- `MaxMem` Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
- `NThreads` Set to the mamimum amount of threads you want to use for this function
- `model_path` A character string of your path file to where you want your output saved
- `metadata_path` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
- `ModelID` A character string to name your model and output
- `NumOfParDepPlots` Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
- `ReturnModelObjects` Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
- `SaveModelObjects` Set to TRUE to return all modeling objects to your environment
- `SaveInfoToPDF` Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory
- `IfSaveModel` Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
- `H2OShutdown` Set to TRUE to shutdown H2O inside the function
- `H2OStartUp` Defaults to TRUE which means H2O will be started inside the function
- `DebugMode` Set to TRUE to get a printout of the steps taken internally
- `GridStrategy` Default "Cartesian"
- `MaxRunTimeSecs` Default 60*60*24
- `StoppingRounds` Number of runs
- `MaxModelsInGrid` Number of models to test from grid options (1080 total possible options)
- `eval_metric` This is the metric used to identify best grid tuned model. Choose from "auc","logloss","aucpr", "lift_top_group","misclassification","mean_per_class_error"
- `CostMatrixWeights` A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1),
- `Trees` The maximum number of trees you want in your models
- `GridTune` Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
- `LearnRate` Default 0.10

`LearnRateAnnealing` Default 1

`Distribution` Choose from "AUTO", "bernoulli", and "quasibinomial"

`MaxDepth` Default 20

`SampleRate` Default 0.632

`ColSampleRate` Default 1

`ColSampleRatePerTree` Default 1

`ColSampleRatePerTreeLevel` Default 1

`MinRows` Default 1

`NBins` Default 20

`NBinsCats` Default 1024

`NBinsTopLevel` Default 1024

`HistogramType` Default "AUTO"

`CategoricalEncoding` Default "AUTO"

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoH2oGBMHurdleModel *AutoH2oGBMHurdleModel*

Description

AutoH2oGBMHurdleModel for hurdle modeing

Usage

```
AutoH2oGBMHurdleModel(
  data,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  TransformNumericColumns = NULL,
  Distribution = "gaussian",
  SplitRatios = c(0.7, 0.2, 0.1),
  ModelID = "ModelTest",
  Paths = NULL,
  MetaDataPaths = NULL,
  SaveModelObjects = TRUE,
  IfSaveModel = "mojo",
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
     intern = TRUE))/1e+06)), "G") },
  NThreads = max(1L, parallel::detectCores() - 2L),
  Trees = 1000L,
  GridTune = TRUE,
  MaxModelsInGrid = 1L,
  NumOfParDepPlots = 10L,
  PassInGrid = NULL
)
```

Arguments

`data`	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
`ValidationData`	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
`TestData`	Souce test data. Do not include a column that has the class labels for the buckets as they are created internally.
`Buckets`	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
`TargetColumnName`	Supply the column name or number for the target variable
`FeatureColNames`	Supply the column names or number of the features (not included the PrimaryDateColumn)
`TransformNumericColumns`	Transform numeric column inside the AutoCatBoostRegression() function
`Distribution`	Set to the distribution of choice based on H2O regression documents.

`SplitRatios`	Supply vector of partition ratios. For example, c(0.70,0.20,0,10).
`ModelID`	Define a character name for your models
`Paths`	The path to your folder where you want your model information saved
`MetaDataPaths`	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.
`SaveModelObjects`	Set to TRUE to save the model objects to file in the folders listed in Paths
`IfSaveModel`	Save as "mojo" or "standard"
`MaxMem`	Set the maximum memory your system can provide
`NThreads`	Set the number of threads you want to dedicate to the model building
`Trees`	Default 1000
`GridTune`	Set to TRUE if you want to grid tune the models
`MaxModelsInGrid`	Set to a numeric value for the number of models to try in grid tune
`NumOfParDepPlots`	Set to pull back N number of partial dependence calibration plots.
`PassInGrid`	Pass in a grid for changing up the parameter settings for catboost

Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoH2oGBMMultiClass *AutoH2oGBMMultiClass*

Description

AutoH2oGBMMultiClass is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, confusion matrix, and variable importance.

Usage

```
AutoH2oGBMMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  WeightsColumn = NULL,
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
    intern = TRUE))/1e+06)), "G") },
  NThreads = max(1L, parallel::detectCores() - 2L),
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3L,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = TRUE,
  H2OStartUp = TRUE,
  DebugMode = FALSE,
  GridTune = FALSE,
  GridStrategy = "Cartesian",
  MaxRunTimeSecs = 60 * 60 * 24,
  StoppingRounds = 10,
  MaxModelsInGrid = 2,
  eval_metric = "auc",
  Trees = 50L,
```

```
  LearnRate = 0.1,
  LearnRateAnnealing = 1,
  Distribution = "multinomial",
  MaxDepth = 20,
  SampleRate = 0.632,
  MTries = -1,
  ColSampleRate = 1,
  ColSampleRatePerTree = 1,
  ColSampleRatePerTreeLevel = 1,
  MinRows = 1,
  NBins = 20,
  NBinsCats = 1024,
  NBinsTopLevel = 1024,
  HistogramType = "AUTO",
  CategoricalEncoding = "AUTO"
)
```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types).
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
WeightsColumn	Column name of a weights column
MaxMem	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
NThreads	Set to the mamimum amount of threads you want to use for this function
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment

IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shutdown H2O inside the function
H2OStartUp	Defaults to TRUE which means H2O will be started inside the function
DebugMode	Set to TRUE to print steps
GridTune	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
GridStrategy	Default "Cartesian"
MaxRunTimeSecs	Default 60*60*24
StoppingRounds	Number of runs
MaxModelsInGrid	Number of models to test from grid options (1080 total possible options)
eval_metric	This is the metric used to identify best grid tuned model. Choose from "auc", "logloss"
Trees	The maximum number of trees you want in your models
LearnRate	Default 0.10
LearnRateAnnealing	Default 1
Distribution	Choose from "multinomial". Placeholder in more options get added
MaxDepth	Default 20
SampleRate	Default 0.632
ColSampleRate	Default 1
ColSampleRatePerTree	Default 1
ColSampleRatePerTreeLevel	Default 1
MinRows	Default 1
NBins	Default 20
NBinsCats	Default 1024
NBinsTopLevel	Default 1024
HistogramType	Default "AUTO"
CategoricalEncoding	Default "AUTO"
SaveInfoToPDF	Set to TRUE to save insights to PDF

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvaluationMetrics.csv, GridCollect, and GridList

Author(s)

AutoH2oGBMRegression *AutoH2oGBMRegression*

Description

AutoH2oGBMRegression is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoH2oGBMRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  WeightsColumn = NULL,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", "Logit"),
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
    intern = TRUE))/1e+06)), "G") },
  NThreads = max(1, parallel::detectCores() - 2),
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  SaveInfoToPDF = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = TRUE,
  H2OStartUp = TRUE,
  DebugMode = FALSE,
  GridTune = FALSE,
  GridStrategy = "Cartesian",
  MaxRunTimeSecs = 60 * 60 * 24,
  StoppingRounds = 10,
  MaxModelsInGrid = 2,
```

```
  eval_metric = "RMSE",
  Trees = 50,
  LearnRate = 0.1,
  LearnRateAnnealing = 1,
  Alpha = NULL,
  Distribution = "poisson",
  MaxDepth = 20,
  SampleRate = 0.632,
  MTries = -1,
  ColSampleRate = 1,
  ColSampleRatePerTree = 1,
  ColSampleRatePerTreeLevel = 1,
  MinRows = 1,
  NBins = 20,
  NBinsCats = 1024,
  NBinsTopLevel = 1024,
  HistogramType = "AUTO",
  CategoricalEncoding = "AUTO"
)
```

Arguments

- `data` This is your data set for training and testing your model
- `TrainOnFull` Set to TRUE to train on full data
- `ValidationData` This is your holdout data set used in modeling either refine your hyperparameters.
- `TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
- `TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types).
- `FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)
- `WeightsColumn` Column name of a weights column
- `TransformNumericColumns` Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed
- `Methods` Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.
- `MaxMem` Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
- `NThreads` Set to the mamimum amount of threads you want to use for this function
- `model_path` A character string of your path file to where you want your output saved
- `metadata_path` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

ModelID — A character string to name your model and output

NumOfParDepPlots — Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

ReturnModelObjects — Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects — Set to TRUE to return all modeling objects to your environment

SaveInfoToPDF — Set to TRUE to save insights to PDF

IfSaveModel — Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

H2OShutdown — Set to TRUE to shutdown H2O inside the function

H2OStartUp — Defaults to TRUE which means H2O will be started inside the function

DebugMode — Set to TRUE to print steps to screen

GridTune — Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy — Default "Cartesian"

MaxRunTimeSecs — Default 60*60*24

StoppingRounds — Number of runs

MaxModelsInGrid — Number of models to test from grid options (1080 total possible options)

eval_metric — This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"

Trees — The maximum number of trees you want in your models

LearnRate — Default 0.10

LearnRateAnnealing — Default 1

Alpha — This is the quantile value you want to use for quantile regression. Must be a decimal between 0 and 1.

Distribution — Choose from gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber"

MaxDepth — Default 20

SampleRate — Default 0.632

ColSampleRate — Default 1

ColSampleRatePerTree — Default 1

ColSampleRatePerTreeLevel — Default 1

MinRows — Default 1

NBins — Default 20

NBinsCats — Default 1024

NBinsTopLevel — Default 1024

HistogramType — Default "AUTO"

CategoricalEncoding — Default "AUTO"

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evalution-Plot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and metadata

  MaxModelsInGrid = 2,
  NumOfParDepPlots = 3,
  GridTune = FALSE,
  GridStrategy = "Cartesian",
  StoppingRounds = 10,
  MaxRunTimeSecs = 3600 * 24 * 7,
  Distribution = "binomial",
  Link = "logit",
  eval_metric = "auc",
  CostMatrixWeights = c(1, 0, 0, 1),
  RandomDistribution = NULL,
  RandomLink = NULL,
  Solver = "AUTO",
  Alpha = 0.5,
  Lambda = NULL,
  LambdaSearch = FALSE,
  NLambdas = -1,
  Standardize = TRUE,
  RemoveCollinearColumns = FALSE,
  InterceptInclude = TRUE,
  NonNegativeCoefficients = FALSE
)
```

Arguments

`data`	This is your data set for training and testing your model
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters.
`TestData`	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TargetColumnName`	Either supply the target column name OR the column number where the target is located (but not mixed types).

FeatureColNames
: Either supply the feature column names OR the column number where the target is located (but not mixed types)

RandomColNumbers
: Random effects column number indicies

InteractionColNumbers
: Column numbers of the features you want to be pairwise interacted

WeightsColumn
: Column name of a weights column

MaxMem
: Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"

NThreads
: Set the number of threads you want to dedicate to the model building

ModelID
: A character string to name your model and output

ReturnModelObjects
: Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

model_path
: A character string of your path file to where you want your output saved

metadata_path
: A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

SaveInfoToPDF
: Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory

IfSaveModel
: Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object

H2OShutdown
: Set to TRUE to shutdown H2O inside the function

H2OStartUp
: Defaults to TRUE which means H2O will be started inside the function

DebugMode
: Set to TRUE to print steps to screen

MaxModelsInGrid
: Number of models to test from grid options (1080 total possible options)

NumOfParDepPlots
: Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy
: "RandomDiscrete" or "Cartesian"

StoppingRounds
: Iterations in grid tuning

MaxRunTimeSecs
: Max run time in seconds

Distribution
: "binomial", "fractionalbinomial", "quasibinomial"

eval_metric
: This is the metric used to identify best grid tuned model. Choose from "auc"

CostMatrixWeights
: A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1),

RandomDistribution
: Random effects family. Defaults NULL, otherwise it will run a hierarchical glm

RandomLink
: Random effects link. Defaults NULL, otherwise it will run a hierarchical glm

Solver	Default "AUTO". Options include "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR
Alpha	Default 0.5 Otherwise supply a value between 0 and 1. 1 is equivalent to Lasso regression. 0 is equivalent to Ridge regression. Inbetween for a blend of the two.
Lambda	Default NULL. Regularization strength.
LambdaSearch	Default FALSE.
NLambdas	Default -1
Standardize	Default TRUE. Standardize numerical columns
RemoveCollinearColumns	Default FALSE. Removes some of the linearly dependent columns
InterceptInclude	Default TRUE
NonNegativeCoefficients	Default FALSE
link	identity, logit, log, inverse, tweedie

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

  NonNegativeCoefficients = FALSE
)
```

Arguments

`data`	This is your data set for training and testing your model
`TrainOnFull`	Set to TRUE to train on full data
`ValidationData`	This is your holdout data set used in modeling either refine your hyperparameters.
`TestData`	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
`TargetColumnName`	Either supply the target column name OR the column number where the target is located (but not mixed types).
`FeatureColNames`	Either supply the feature column names OR the column number where the target is located (but not mixed types)
`RandomColNumbers`	Random effects column number indicies
`InteractionColNumbers`	Column numbers of the features you want to be pairwise interacted
`WeightsColumn`	Column name of a weights column
`MaxMem`	Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
`NThreads`	Set the number of threads you want to dedicate to the model building
`ModelID`	A character string to name your model and output
`ReturnModelObjects`	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
`model_path`	A character string of your path file to where you want your output saved
`metadata_path`	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
`DebugMode`	Set to TRUE to see a printout of each step
`SaveModelObjects`	Set to TRUE to return all modeling objects to your environment
`SaveInfoToPDF`	Set to TRUE to save insights to PDF
`IfSaveModel`	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
`H2OShutdown`	Set to TRUE to shutdown H2O inside the function
`H2OStartUp`	Defaults to TRUE which means H2O will be started inside the function
`MaxModelsInGrid`	Number of models to test from grid options (1080 total possible options)
`NumOfParDepPlots`	Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)
`GridTune`	Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.
`GridStrategy`	"RandomDiscrete" or "Cartesian"

StoppingRounds Iterations in grid tuning

MaxRunTimeSecs Max run time in seconds

Distribution "multinomial"

eval_metric This is the metric used to identify best grid tuned model. Choose from "logloss"

RandomDistribution
Random effects family. Defaults NULL, otherwise it will run a hierarchical glm

RandomLink Random effects link. Defaults NULL, otherwise it will run a hierarchical glm

Solver Default "AUTO". Options include "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR

Alpha Default 0.5 Otherwise supply a value between 0 and 1. 1 is equivalent to Lasso regression. 0 is equivalent to Ridge regression. Inbetween for a blend of the two.

Lambda Default NULL. Regularization strength.

LambdaSearch Default FALSE.

NLambdas Default -1

Standardize Default TRUE. Standardize numerical columns

RemoveCollinearColumns
Default FALSE. Removes some of the linearly dependent columns

InterceptInclude
Default TRUE

NonNegativeCoefficients
Default FALSE

link "family_default"

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvaluationMetrics.csv, GridCollect, and GridList

AutoH2oGLMRegression *AutoH2oGLMRegression*

Description

AutoH2oGLMis an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoH2oGLMRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  RandomColNumbers = NULL,
  InteractionColNumbers = NULL,
  WeightsColumn = NULL,
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
     intern = TRUE))/1e+06)), "G") },
  NThreads = max(1, parallel::detectCores() - 2),
  ModelID = "FirstModel",
  ReturnModelObjects = TRUE,
  model_path = NULL,
  metadata_path = NULL,
  SaveModelObjects = FALSE,
  SaveInfoToPDF = FALSE,
  IfSaveModel = "mojo",
  H2OShutdown = TRUE,
  H2OStartUp = TRUE,
  DebugMode = FALSE,
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", "Logit"),
  NumOfParDepPlots = 3,
  GridTune = FALSE,
  GridStrategy = "Cartesian",
  StoppingRounds = 10,
  MaxRunTimeSecs = 3600 * 24 * 7,
  MaxModelsInGrid = 2,
  Distribution = "gaussian",
  Link = "identity",
  TweedieLinkPower = NULL,
  TweedieVariancePower = NULL,
  eval_metric = "RMSE",
```

```
  RandomDistribution = NULL,
  RandomLink = NULL,
  Solver = "AUTO",
  Alpha = 0.5,
  Lambda = NULL,
  LambdaSearch = FALSE,
  NLambdas = -1,
  Standardize = TRUE,
  RemoveCollinearColumns = FALSE,
  InterceptInclude = TRUE,
  NonNegativeCoefficients = FALSE
)
```

Arguments

- `data` This is your data set for training and testing your model
- `TrainOnFull` Set to TRUE to train on full data
- `ValidationData` This is your holdout data set used in modeling either refine your hyperparameters.
- `TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
- `TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types).
- `FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)
- `RandomColNumbers` Random effects column number indicies
- `InteractionColNumbers` Column numbers of the features you want to be pairwise interacted
- `WeightsColumn` Column name of a weights column
- `MaxMem` Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"
- `NThreads` Set the number of threads you want to dedicate to the model building
- `ModelID` A character string to name your model and output
- `ReturnModelObjects` Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
- `model_path` A character string of your path file to where you want your output saved
- `metadata_path` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
- `SaveModelObjects` Set to TRUE to return all modeling objects to your environment
- `SaveInfoToPDF` Set to TRUE to save insights to PDF
- `IfSaveModel` Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
- `H2OShutdown` Set to TRUE to shutdown H2O inside the function

H2OStartUp
: Defaults to TRUE which means H2O will be started inside the function

DebugMode
: Set to TRUE to print out steps to screen

TransformNumericColumns
: Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed

Methods
: Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.

NumOfParDepPlots
: Tell the function the number of partial dependence calibration plots you want to create. Calibration boxplots will only be created for numerical features (not dummy variables)

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

GridStrategy
: "RandomDiscrete" or "Cartesian"

StoppingRounds
: Iterations in grid tuning

MaxRunTimeSecs
: Max run time in seconds

MaxModelsInGrid
: Number of models to test from grid options (1080 total possible options)

Distribution
: "AUTO", "gaussian", "poisson", "gamma", "tweedie", "negativebinomial"

Link
: "family_default", "identity", "log", "inverse", "tweedie"

TweedieLinkPower
: See h2o docs for background

TweedieVariancePower
: See h2o docs for background

eval_metric
: This is the metric used to identify best grid tuned model. Choose from "MSE", "RMSE", "MAE", "RMSLE"

RandomDistribution
: Random effects family. Defaults NULL, otherwise it will run a hierarchical glm

RandomLink
: Random effects link. Defaults NULL, otherwise it will run a hierarchical glm

Solver
: Default "AUTO". Options include "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR

Alpha
: Default 0.5 Otherwise supply a value between 0 and 1. 1 is equivalent to Lasso regression. 0 is equivalent to Ridge regression. Inbetween for a blend of the two.

Lambda
: Default NULL. Regularization strength.

LambdaSearch
: Default FALSE.

NLambdas
: Default -1

Standardize
: Default TRUE. Standardize numerical columns

RemoveCollinearColumns
: Default FALSE. Removes some of the linearly dependent columns

InterceptInclude
: Default TRUE

NonNegativeCoefficients
: Default FALSE

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, GridList, and Transformation metadata

`AutoH2oMLClassifier` *AutoH2oMLClassifier*

Description

AutoH2oMLClassifier is an automated H2O modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation metrics, variable importance, partial dependence calibration plots, and column names used in model fitting.

Usage

```
AutoH2oMLClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
```

```
  ExcludeAlgos = NULL,
  eval_metric = "auc",
  CostMatrixWeights = c(1, 0, 0, 1),
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
    intern = TRUE))/1e+06)), "G") },
  NThreads = max(1, parallel::detectCores() - 2),
  MaxModelsInGrid = 2,
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  NumOfParDepPlots = 3,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  SaveInfoToPDF = TRUE,
  IfSaveModel = "mojo",
  H2OShutdown = TRUE,
  H2OStartUp = TRUE,
  DebugMode = FALSE
)
```

Arguments

`data` This is your data set for training and testing your model

`TrainOnFull` Set to TRUE to train on full data

`ValidationData` This is your holdout data set used in modeling either refine your hyperparameters.

`TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

`TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 | 1 numeric variable.

`FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)

`ExcludeAlgos` "DRF","GLM","XGBoost","GBM","DeepLearning" and "Stacke-dEnsemble"

`eval_metric` This is the metric used to identify best grid tuned model. Choose from "AUC" or "logloss"

`CostMatrixWeights` A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1),

`MaxMem` Set the maximum amount of memory you'd like to dedicate to the model run. E.g. "32G"

`NThreads` Set the number of threads you want to dedicate to the model building

`MaxModelsInGrid` Number of models to test from grid options (1080 total possible options)

`model_path` A character string of your path file to where you want your output saved

metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output
NumOfParDepPlots	Tell the function the number of partial dependence calibration plots you want to create.
ReturnModelObjects	Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)
SaveModelObjects	Set to TRUE to return all modeling objects to your environment
SaveInfoToPDF	Set to TRUE to print model insights to PDF
IfSaveModel	Set to "mojo" to save a mojo file, otherwise "standard" to save a regular H2O model object
H2OShutdown	Set to TRUE to shutdown H2O after running the function
H2OStartUp	Set to FALSE
DebugMode	Set to TRUE to print out steps taken

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, Evalution-Plot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoH2OMLScoring *AutoH2OMLScoring*

Description

AutoH2OMLScoring is an automated scoring function that compliments the AutoH2oGBM__() and AutoH2oDRF__() models training functions. This function requires you to supply features for scoring. It will run ModelDataPrep()to prepare your features for H2O data conversion and scoring.

Usage

```
AutoH2OMLScoring(
  ScoringData = NULL,
  ModelObject = NULL,
  ModelType = "mojo",
  H2OShutdown = TRUE,
  H2OStartUp = TRUE,
  MaxMem = {     gc()
   paste0(as.character(floor(as.numeric(system("awk '/MemFree/ {print $2}' /proc/meminfo",
     intern = TRUE))/1e+06)), "G") },
  NThreads = max(1, parallel::detectCores() - 2),
```

```
  JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = TRUE,
  MDP_CharToFactor = TRUE,
  MDP_RemoveDates = TRUE,
  MDP_MissFactor = "0",
  MDP_MissNum = -1
)
```

Arguments

`ScoringData` This is your data.table of features for scoring. Can be a single row or batch.

`ModelObject` Supply a model object from AutoH2oDRF__()

`ModelType` Set to either "mojo" or "standard" depending on which version you saved

`H2OShutdown` Set to TRUE to shutdown H2O inside the function.

`H2OStartUp` Defaults to TRUE which means H2O will be started inside the function

`MaxMem` Set to you dedicated amount of memory. E.g. "28G"

`NThreads` Default set to max(1, parallel::detectCores()-2)

`JavaOptions` Change the default to your machines specification if needed. Default is '-Xmx1g -XX:ReservedCodeCacheSize=256m',

`ModelPath` Supply your path file used in the AutoH2o__() function

`ModelID` Supply the model ID used in the AutoH2o__() function

`ReturnFeatures` Set to TRUE to return your features with the predicted values.

`TransformNumeric` Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.

`BackTransNumeric` Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.

`TargetColumnName` Input your target column name used in training if you are utilizing the transformation service

`TransformationObject` Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file.

`TransID` Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().

`TransPath` Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.

`MDP_Impute` Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function

`MDP_CharToFactor` Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function

`MDP_RemoveDates` Set to TRUE if you have date of timestamp columns in your ScoringData

`MDP_MissFactor` If you set MDP_Impute to TRUE, supply the character values to replace missing values with

`MDP_MissNum` If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with

Value

A data.table of predicted values with the option to return model features as well.

  MDP_MissFactor = "0",
  MDP_MissNum = -1)

## End(Not run)
```

AutoHierarchicalFourier
AutoHierarchicalFourier

Description

AutoHierarchicalFourier reverses the difference

Usage

```
AutoHierarchicalFourier(
  datax = data,
  xRegs = names(XREGS),
  FourierTermS = FourierTerms,
  TimeUniT = TimeUnit,
  FC_PeriodS = FC_Periods,
  TargetColumN = TargetColumn,
  DateColumN = DateColumnName,
  HierarchGroups = NULL,
  IndependentGroups = NULL
)
```

Arguments

datax	data
xRegs	The XREGS
FourierTermS	Number of fourier pairs
TimeUniT	Time unit
FC_PeriodS	Number of forecast periods
TargetColumN	Target column name
DateColumN	Date column name
HierarchGroups	Character vector of categorical columns to fully interact
IndependentGroups	Character vector of categorical columns to run independently

AutoHurdleScoring *AutoHurdleScoring*

Description

AutoHurdleScoring can score AutoCatBoostHurdleModel() and AutoXGBoostHurdleModel()

Usage

```
AutoHurdleScoring(
  TestData = NULL,
  Path = NULL,
  ModelID = NULL,
  ModelClass = "catboost",
  ArgList = NULL,
  ModelList = NULL,
  Threshold = NULL
)
```

Arguments

TestData	scoring data.table
Path	Supply if ArgList is NULL or ModelList is null.
ModelID	Supply if ArgList is NULL or ModelList is null. Same as used in model training.
ModelClass	Name of model type. "catboost" is currently the only available option
ArgList	Output from the hurdle model
ModelList	Output from the hurdle model
Threshold	NULL to use raw probabilities to predict. Otherwise, supply a threshold

Value

A data.table with the final predicted value, the intermediate model predictions, and your source data

```

`AutoInteraction` *AutoInteraction*

Description

AutoInteraction creates interaction variables from your numerical features in your data. Supply a set of column names to utilize and set the interaction level. Supply a character vector of columns to exclude and the function will ignore those features.

Usage

```
AutoInteraction(
  data = NULL,
  NumericVars = NULL,
  InteractionDepth = 2,
  Center = TRUE,
  Scale = TRUE,
  SkipCols = NULL,
  Scoring = FALSE,
  File = NULL
)
```

Arguments

`data`	Source data.table
`InteractionDepth`	The max K in N choose K. If NULL, K will loop through 1 to length(NumVars). Default is 2 for pairwise interactions
`Center`	TRUE to center the data
`Scale`	TRUE to scale the data
`SkipCols`	Use this to exclude features from being created. An example could be, you build a model with all variables and then use the varaible importance list to determine which features aren't necessary and pass that set of features into this argument as a character vector.

Scoring	Defaults to FALSE. Set to TRUE for generating these columns in a model scoring setting
File	When Scoring is set to TRUE you have to supply either the .Rdata list with lookup values for recreating features or a pathfile to the .Rdata file with the lookup values. If you didn't center or scale the data then this argument can be ignored.
NumVars	Names of numeric columns (if NULL, all numeric and integer columns will be used)

`AutoLagRollStats` *AutoLagRollStats*

Description

AutoLagRollStats Builds lags and a large variety of rolling statistics with options to generate them for hierarchical categorical interactions.

Usage

```
AutoLagRollStats(
  data,
  Targets = NULL,
  HierarchyGroups = NULL,
  IndependentGroups = NULL,
  DateColumn = NULL,
  TimeUnit = "day",
  TimeUnitAgg = "day",
  TimeGroups = "day",
  TimeBetween = NULL,
  RollOnLag1 = TRUE,
  Type = "Lag",
  SimpleImpute = TRUE,
  Lags = c(1:5),
  MA_RollWindows = c(2, 5, 10),
  SD_RollWindows = c(5, 10),
  Skew_RollWindows = c(5, 10),
  Kurt_RollWindows = c(5, 10),
  Quantile_RollWindows = c(10),
  Quantiles_Selected = c("q25", "q75"),
  Debug = FALSE
)
```

Arguments

`data`	A data.table you want to run the function on
`Targets`	A character vector of the column names for the reference column in which you will build your lags and rolling stats
`HierarchyGroups`	A vector of categorical column names that you want to have generate all lags and rolling stats done for the individual columns and their full set of interactions.
`IndependentGroups`	A vector of categorical column names that you want to have run independently of each other. This will mean that no interaction will be done.
`DateColumn`	The column name of your date column used to sort events over time
`TimeUnit`	List the time aggregation level for the time between events features, such as "hour", "day", "weeks", "months", "quarter", or "year"
`TimeUnitAgg`	List the time aggregation of your data that you want to use as a base time unit for your features. E.g. "raw" or "day"
`TimeGroups`	A vector of TimeUnits indicators to specify any time-aggregated GDL features you want to have returned. E.g. c("raw" (no aggregation is done),"hour", "day","week","month","quarter","year")
`TimeBetween`	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.

`RollOnLag1` Set to FALSE to build rolling stats off of target columns directly or set to TRUE to build the rolling stats off of the lag-1 target

`Type` List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values

`SimpleImpute` Set to TRUE for factor level imputation of "0" and numeric imputation of -1

`Lags` A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.

`MA_RollWindows` A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.

`SD_RollWindows` A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.

`Skew_RollWindows` A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.

`Kurt_RollWindows` A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.

`Quantile_RollWindows` A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.

`Quantiles_Selected` Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60"," q65", "q70", "q75", "q80", "q85", "q90", "q95")

`Debug` Set to TRUE to get a print of which steps are running

Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

Author(s)

Adrian Antico

AutoLagRollStatsScoring

AutoLagRollStatsScoring

Description

AutoLagRollStatsScoring Builds lags and a large variety of rolling statistics with options to generate them for hierarchical categorical interactions.

Usage

```
AutoLagRollStatsScoring(
  data,
  RowNumsID = "temp",
  RowNumsKeep = 1,
  Targets = NULL,
  HierarchyGroups = NULL,
  IndependentGroups = NULL,
  DateColumn = NULL,
  TimeUnit = "day",
  TimeUnitAgg = "day",
  TimeGroups = "day",
  TimeBetween = NULL,
  RollOnLag1 = 1,
  Type = "Lag",
  SimpleImpute = TRUE,
  Lags = NULL,
  MA_RollWindows = NULL,
  SD_RollWindows = NULL,
  Skew_RollWindows = NULL,
  Kurt_RollWindows = NULL,
  Quantile_RollWindows = NULL,
  Quantiles_Selected = NULL,
  Debug = FALSE
)
```

Arguments

`data`	A data.table you want to run the function on
`RowNumsID`	The name of your column used to id the records so you can specify which rows to keep
`RowNumsKeep`	The RowNumsID numbers that you want to keep
`Targets`	A character vector of the column names for the reference column in which you will build your lags and rolling stats
`HierarchyGroups`	A vector of categorical column names that you want to have generate all lags and rolling stats done for the individual columns and their full set of interactions.
`IndependentGroups`	Only supply if you do not want HierarchyGroups. A vector of categorical column names that you want to have run independently of each other. This will mean that no interaction will be done.
`DateColumn`	The column name of your date column used to sort events over time
`TimeUnit`	List the time aggregation level for the time between events features, such as "hour", "day", "weeks", "months", "quarter", or "year"
`TimeUnitAgg`	List the time aggregation of your data that you want to use as a base time unit for your features. E.g. "day",

`TimeGroups` A vector of TimeUnits indicators to specify any time-aggregated GDL features you want to have returned. E.g. c("hour", "day","week","month","quarter","year"). STILL NEED TO ADD these '1min', '5min', '10min', '15min', '30min', '45min'

`TimeBetween` Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.

`RollOnLag1` Set to FALSE to build rolling stats off of target columns directly or set to TRUE to build the rolling stats off of the lag-1 target

`Type` List either "Lag" if you want features built on historical values or "Lead" if you want features built on future values

`SimpleImpute` Set to TRUE for factor level imputation of "0" and numeric imputation of -1

`Lags` A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.

`MA_RollWindows` A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.

`SD_RollWindows` A numeric vector of Standard Deviation rolling statistics window sizes you want to utilize in the calculations.

`Skew_RollWindows` A numeric vector of Skewness rolling statistics window sizes you want to utilize in the calculations.

`Kurt_RollWindows` A numeric vector of Kurtosis rolling statistics window sizes you want to utilize in the calculations.

`Quantile_RollWindows` A numeric vector of Quantile rolling statistics window sizes you want to utilize in the calculations.

`Quantiles_Selected` Select from the following c("q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60"," q65", "q70", "q75", "q80", "q85", "q90", "q95")

`Debug` Set to TRUE to get a print out of which step you are on

Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

Author(s)

Adrian Antico

`AutoMarketBasketModel` *AutoMarketBasketModel*

Description

AutoMarketBasketModel function runs a market basket analysis automatically. It will convert your data, run the algorithm, and add on additional significance values not orginally contained within.

Usage

```
AutoMarketBasketModel(
  data,
  OrderIDColumnName,
  ItemIDColumnName,
  LHS_Delimeter = ",",
  Support = 0.001,
  Confidence = 0.1,
  MaxLength = 2,
  MinLength = 2,
  MaxTime = 5
)
```

Arguments

`data`	This is your transactions data set
`OrderIDColumnName`	Supply your column name for the Order ID Values
`ItemIDColumnName`	Supply your column name for the Item ID Values
`LHS_Delimeter`	Default delimeter for separating multiple ItemID's is a comma.
`Support`	Threshold for inclusion using support
`Confidence`	Threshold for inclusion using confidence
`MaxLength`	Maximum combinations of Item ID (number of items in basket to consider)
`MinLength`	Minimum length of combinations of ItemID (number of items in basket to consider)
`MaxTime`	Max run time per iteration (default is 5 seconds)

  MaxLength = 2,
  MinLength = 2,
  MaxTime = 5)

## End(Not run)
```

AutoNLS *AutoNLS*

Description

This function will build models for 9 different nls models, along with a non-parametric monotonic regression and a polynomial regression. The models are evaluated, a winner is picked, and the predicted values are stored in your data table.

Usage

```
AutoNLS(data, y, x, monotonic = TRUE)
```

Arguments

data	Data is the data table you are building the modeling on
y	Y is the target variable name in quotes
x	X is the independent variable name in quotes
monotonic	This is a TRUE/FALSE indicator - choose TRUE if you want monotonic regression over polynomial regression

Value

A list containing "PredictionData" which is a data table with your original column replaced by the nls model predictions; "ModelName" the model name; "ModelObject" The winning model to later use; "EvaluationMetrics" Model metrics for models with ability to build.

AutoRecomDataCreate *AutoRecomDataCreate*

Description

AutoRecomDataCreate to create data that is prepared for modeling

Usage

```
AutoRecomDataCreate(
  data,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  MetricColName = "TotalSales",
  ReturnMatrix = FALSE
)
```

Arguments

data	This is your transactional data.table. Must include an Entity (typically customer), ProductCode (such as SKU), and a sales metric (such as total sales).
EntityColName	This is the column name in quotes that represents the column name for the Entity, such as customer
ProductColName	This is the column name in quotes that represents the column name for the product, such as SKU
MetricColName	This is the column name in quotes that represents the column name for the metric, such as total sales
ReturnMatrix	Set to FALSE to coerce the object (desired route) or TRUE to return a matrix

Value

A BinaryRatingsMatrix

Other Recommenders: AutoMarketBasketModel(), AutoRecommenderScoring(), AutoRecommender()

Examples

```
## Not run:
RatingsMatrix <- AutoRecomDataCreate(
  data,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  MetricColName = "TotalSales",
  ReturnMatrix = TRUE)

## End(Not run)
```

AutoRecommender — *Automatically build the best recommender model among models available.*

Description

This function returns the winning model that you pass onto AutoRecommenderScoring

Usage

```
AutoRecommender(
  data,
  Partition = "Split",
  KFolds = 1,
  Ratio = 0.75,
  Given = 1,
  RatingType = "TopN",
  RatingsKeep = 20,
  SkipModels = "AssociationRules",
  ModelMetric = "TPR"
)
```

Arguments

`data`	This is your BinaryRatingsMatrix. See function RecomDataCreate
`Partition`	Choose from "split", "cross-validation", "bootstrap". See evaluationScheme in recommenderlab for details.
`KFolds`	Choose 1 for traditional train and test. Choose greater than 1 for the number of cross validations
`Ratio`	The ratio for train and test. E.g. 0.75 for 75 percent data allocated to training
`Given`	The number of products you would like to evaluate. Negative values implement all-but schemes.
`RatingType`	Choose from "TopN", "ratings", "ratingMatrix"
`RatingsKeep`	The total ratings you wish to return. Default is 20.
`SkipModels`	AssociationRules runs the slowest and may crash your system. Choose from: "AssociationRules","ItemBasedCF","UserBasedCF","PopularItems","RandomItems"
`ModelMetric`	Choose from "Precision", "Recall", "TPR", or "FPR"

Value

The winning model used for scoring in the AutoRecommenderScoring function

  RatingType = "TopN",
  RatingsKeep = 20,
  SkipModels = "AssociationRules",
  ModelMetric = "TPR")

## End(Not run)
```

AutoRecommenderScoring

The AutoRecomScoring function scores recommender models from AutoRecommender()

Description

This function will take your ratings matrix and model and score your data in parallel.

This function will take your ratings matrix and model and score your data in parallel.

Usage

```
AutoRecommenderScoring(
  data,
  WinningModel,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
  NumItemsReturn = 1
)

AutoRecommenderScoring(
  data,
  WinningModel,
  EntityColName = "CustomerID",
  ProductColName = "StockCode",
```

```
  NumItemsReturn = 1
)
```

Arguments

data	The binary ratings matrix from RecomDataCreate()
WinningModel	The winning model returned from AutoRecommender()
EntityColName	Typically your customer ID
ProductColName	Something like "StockCode"
NumItemsReturn	Number of items to return on scoring

Value

Returns the prediction data

Returns the prediction data

```

AutoTBATS *AutoTBATS*

Description

AutoTBATS is a multi-armed bandit model testing framework for AR and SAR NNets. Randomized probability matching is the underlying bandit algorithm. Model evaluation is done by blending the training error and the validation error from testing the model on out of sample data. The bandit algorithm compares the performance of the current build against the previous builds which starts with the classic nnetar model from the forecast package. Depending on how many lags, seasonal lags, and fourier pairs you test the number of combinations of features to test begins to approach 10,000 different combinations of settings. The function tests out transformations, differencing, and variations of the lags, seasonal lags, and fourier pairs. The paramter space is broken up into various buckets that are increasing in sophistication. The bandit algorithm samples from those buckets and based on many rounds of testing it determines which buckets to generate samples from more frequently based on the models performance coming from that bucket. All of the models have performance data collected on them and a final rebuild is initiated when a winner is found. The rebuild process begins by retraining the model with the settings that produced the best performance. If the model fails to build, for whatever reason, the next best buildable model is rebuilt.

Usage

```
AutoTBATS(
  data,
  FilePath = NULL,
  TargetVariableName,
  DateColumnName,
  TimeAggLevel = "week",
  EvaluationMetric = "MAE",
```

```
  NumHoldOutPeriods = 5L,
  NumFCPeriods = 5L,
  MaxLags = 5L,
  MaxMovingAverages = 5L,
  MaxSeasonalPeriods = 1L,
  TrainWeighting = 0.5,
  MaxConsecutiveFails = 12L,
  MaxNumberModels = 100L,
  MaxRunTimeMinutes = 10L,
  NumberCores = max(1L, min(4L, parallel::detectCores() - 2L))
)
```

Arguments

`data` Source data.table

`FilePath` NULL to return nothing. Provide a file path to save the model and xregs if available

`TargetVariableName` Name of your time series target variable

`DateColumnName` Name of your date column

`TimeAggLevel` Choose from "year", "quarter", "month", "week", "day", "hour"

`EvaluationMetric` Choose from MAE, MSE, and MAPE

`NumHoldOutPeriods` Number of time periods to use in the out of sample testing

`NumFCPeriods` Number of periods to forecast

`MaxLags` A single value of the max number of lags to use in the internal auto.arima of tbats

`MaxMovingAverages` A single value of the max number of moving averages to use in the internal auto.arima of tbats

`MaxSeasonalPeriods` A single value for the max allowable seasonal periods to be tested in the tbats framework

`TrainWeighting` Model ranking is based on a weighted average of training metrics and out of sample metrics. Supply the weight of the training metrics, such as 0.50 for 50 percent.

`MaxConsecutiveFails` When a new best model is found MaxConsecutiveFails resets to zero. Indicated the number of model attemps without a new winner before terminating the procedure.

`MaxNumberModels` Indicate the maximum number of models to test.

`MaxRunTimeMinutes` Indicate the maximum number of minutes to wait for a result.

`NumberCores` Default max(1L, min(4L, parallel::detectCores()-2L))

AutoTransformationCreate

AutoTransformationCreate

Description

AutoTransformationCreate is a function for automatically identifying the optimal transformations for numeric features and transforming them once identified. This function will loop through your selected transformation options (YeoJohnson, BoxCox, Asinh, Asin, and Logit) and find the one that produces data that is the closest to normally distributed data. It then makes the transformation and collects the metadata information for use in the AutoTransformationScore() function, either by returning the objects (always) or saving them to file (optional).

Usage

```
AutoTransformationCreate(
  data,
```

```
  ColumnNames = NULL,
  Methods = c("BoxCox", "YeoJohnson", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin",
    "Logit", "Identity"),
  Path = NULL,
  TransID = "ModelID",
  SaveOutput = FALSE
)
```

Arguments

data	This is your source data
ColumnNames	List your columns names in a vector, for example, c("Target", "IV1")
Methods	Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Asin", "Logit", and "Identity".
Path	Set to the directly where you want to save all of your modeling files
TransID	Set to a character value that corresponds with your modeling project
SaveOutput	Set to TRUE to save necessary file to run AutoTransformationScore()

Value

data with transformed columns and the transformation object for back-transforming later

  TransID = "Trans",
  SaveOutput = TRUE)

## End(Not run)
```

AutoTransformationScore
AutoTransformationScore() is a the complimentary function to AutoTransformationCreate()

Description

AutoTransformationScore() is a the compliment function to AutoTransformationCreate(). Automatically apply or inverse the transformations you identified in AutoTransformationCreate() to other data sets. This is useful for applying transformations to your validation and test data sets for modeling. It's also useful for back-transforming your target and prediction columns after you have build and score your models so you can obtain statistics on the original features.

Usage

```
AutoTransformationScore(
  ScoringData,
  FinalResults,
  Type = "Inverse",
  TransID = "TestModel",
  Path = NULL
)
```

Arguments

ScoringData	This is your source data
FinalResults	This is the FinalResults output object from AutoTransformationCreate().
Type	Set to "Inverse" to back-transfrom or "Apply" for applying the transformation.
TransID	Set to a character value that corresponds with your modeling project
Path	Set to the directly where you want to save all of your modeling files

Value

data with transformed columns

Author(s)

Adrian Antico

  TransID = "Model_1")

## End(Not run)
```

`AutoTS` *AutoTS*

Description

Step 1 is to build all the models and evaluate them on the number of HoldOutPeriods periods you specify. Step 2 is to pick the winner and rebuild the winning model on the full data set. Step 3 is to generate forecasts with the final model for FCPeriods that you specify. AutoTS builds the best time series models for each type, using optimized box-cox transformations and using a user-supplied frequency for the ts data conversion along with a model-based frequency for the ts data conversion, compares all types, selects the winner, and generates a forecast. Models include:

DSHW: Double Seasonal Holt Winters

ARFIMA: Auto Regressive Fractional Integrated Moving Average

ARIMIA: Stepwise Auto Regressive Integrated Moving Average with specified max lags, seasonal lags, moving averages, and seasonal moving averages

ETS: Additive and Multiplicitive Exponential Smoothing and Holt Winters

NNetar: Auto Regressive Neural Network models automatically compares models with 1 lag or 1 seasonal lag compared to models with up to N lags and N seasonal lags

TBATS: Exponential smoothing state space model with Box-Cox transformation, ARMA errors, Trend and Seasonal components

TSLM: Time Series Linear Model - builds a linear model with trend and season components extracted from the data

Usage

```
AutoTS(
  data,
  TargetName = "Target",
  DateName = "DateTime",
  FCPeriods = 30,
  HoldOutPeriods = 30,
  EvaluationMetric = "MAPE",
  InnerEval = "AICc",
  TimeUnit = "day",
  Lags = 25,
  SLags = 2,
  MaxFourierPairs = 0,
  NumCores = 4,
  SkipModels = NULL,
  StepWise = TRUE,
  TSClean = TRUE,
  ModelFreq = TRUE,
  PrintUpdates = FALSE,
  PlotPredictionIntervals = TRUE
)
```

Arguments

`data`	is the source time series data as a data.table - or a data structure that can be converted to a data.table
`TargetName`	is the name of the target variable in your data.table
`DateName`	is the name of the date column in your data.table
`FCPeriods`	is the number of periods into the future you wish to forecast
`HoldOutPeriods`	is the number of periods to use for validation testing
`EvaluationMetric`	Set this to either "MAPE", "MSE", or "MAE". Default is "MAPE"
`InnerEval`	Choose from AICC, AIC, and BIC. These are what the time series models use internally to optimize
`TimeUnit`	is the level of aggregation your dataset comes in. Choices include: hour, day, week, month, quarter, year, 1Min, 5Min, 10Min, 15Min, and 30Min

`Lags` is the number of lags you wish to test in various models (same as moving averages)

`SLags` is the number of seasonal lags you wish to test in various models (same as moving averages)

`MaxFourierPairs` Set the max number of Fourier terms to test out. They will be utilized in the ARIMA and NN models.

`NumCores` is the number of cores available on your computer

`SkipModels` Don't run specified models - e.g. exclude all models "DSHW" "ARFIMA" "ARIMA" "ETS" "NNET" "TBATS" "TSLM"

`StepWise` Set to TRUE to have ARIMA and ARFIMA run a stepwise selection process. Otherwise, all models will be generated in parallel execution, but still run much slower.

`TSClean` Set to TRUE to have missing values interpolated and outliers replaced with interpolated values: creates separate models for a larger comparison set

`ModelFreq` Set to TRUE to run a separate version of all models where the time series frequency is chosen algorithmically

`PrintUpdates` Set to TRUE for a print to console of function progress

`PlotPredictionIntervals` Set to FALSE to not print prediction intervals on your plot output

Value

Returns a list containing 1: A data.table object with a date column and the forecasted values; 2: The model evaluation results; 3: The champion model for later use if desired; 4: The name of the champion model; 5. A time series ggplot with historical values and forecasted values with 80

`AutoWord2VecModeler` *AutoWord2VecModeler*

Description

This function allows you to automatically build a word2vec model and merge the data onto your supplied dataset

Usage

```
AutoWord2VecModeler(
  data,
  BuildType = "Combined",
  stringCol = c("Text_Col1", "Text_Col2"),
  KeepStringCol = FALSE,
  model_path = NULL,
  vects = 100,
  MinWords = 1,
  WindowSize = 12,
  Epochs = 25,
  SaveModel = "standard",
  Threads = max(1L, parallel::detectCores() - 2L),
  MaxMemory = "28G",
  ModelID = "Model_1"
)
```

Arguments

`data`	Source data table to merge vects onto
`BuildType`	Choose from "individual" or "combined". Individual will build a model for every text column. Combined will build a single model for all columns.

stringCol	A string name for the column to convert via word2vec
KeepStringCol	Set to TRUE if you want to keep the original string column that you convert via word2vec
model_path	A string path to the location where you want the model and metadata stored
vects	The number of vectors to retain from the word2vec model
MinWords	For H2O word2vec model
WindowSize	For H2O word2vec model
Epochs	For H2O word2vec model
SaveModel	Set to "standard" to save normally; set to "mojo" to save as mojo. NOTE: while you can save a mojo, I haven't figured out how to score it in the AutoH20Scoring function.
Threads	Number of available threads you want to dedicate to model building
MaxMemory	Amount of memory you want to dedicate to model building
ModelID	Name for saving to file

AutoWord2VecScoring *AutoWord2VecScoring*

Description

AutoWord2VecScoring is for scoring models generated by AutoWord2VecModeler()

Usage

```
AutoWord2VecScoring(
  data,
  BuildType = "individual",
  ModelObject = NULL,
  ModelID = "Model_1",
```

```
  model_path = NULL,
  stringCol = NULL,

  H2OStartUp = TRUE,
  H2OShutdown = TRUE,
  Threads = max(1L, parallel::detectCores() - 2L),
  MaxMemory = "28G"
)
```

Arguments

data	data.table
BuildType	"individual" or "combined". Used to locate model in file
ModelObject	NULL if you want it loaded in the function
ModelID	Same as in training
model_path	Location of model
stringCol	Columns to transform
KeepStringCol	FALSE to remove string col after creating vectors
H2OStartUp	= TRUE,
Threads	max(1L, parallel::detectCores() - 2L)
MaxMemory	"28G"

`AutoWordFreq` *Automated Word Frequency and Word Cloud Creation*

Description

This function builds a word frequency table and a word cloud. It prepares data, cleans text, and generates output.

Usage

```
AutoWordFreq(
  data,
  TextColName = "DESCR",
  GroupColName = "ClusterAllNoTarget",
  GroupLevel = 0,
  RemoveEnglishStopwords = TRUE,
  Stemming = TRUE,
  StopWords = c("bla", "bla2")
)
```

Arguments

`data`	Source data table
`TextColName`	A string name for the column
`GroupColName`	Set to NULL to ignore, otherwise set to Cluster column name (or factor column name)
`GroupLevel`	Must be set if GroupColName is defined. Set to cluster ID (or factor level)
`RemoveEnglishStopwords`	Set to TRUE to remove English stop words, FALSE to ignore
`Stemming`	Set to TRUE to run stemming on your text data
`StopWords`	Add your own stopwords, in vector format

  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  NTrees = 1000L,
  LearningRate = 0.3,
  MaxDepth = 9L,
  MinChildWeight = 1,
  SubSample = 1,
  ColSampleByTree = 1
)
```

Arguments

`data`	Supply your full series data set here
`NonNegativePred`	TRUE or FALSE
`RoundPreds`	Rounding predictions to an integer value. TRUE or FALSE. Defaults to FALSE
`TrainOnFull`	Set to TRUE to train on full data
`TargetColumnName`	List the column name of your target variables column. E.g. "Target"
`DateColumnName`	List the column name of your date column. E.g. "DateTime"
`HierarchGroups`	= NULL Character vector or NULL with names of the columns that form the interaction hierarchy
`GroupVariables`	Defaults to NULL. Use NULL when you have a single series. Add in GroupVariables when you have a series for every level of a group or multiple groups.
`FC_Periods`	Set the number of periods you want to have forecasts for. E.g. 52 for weekly data to forecast a year ahead
`SaveDataPath`	Path to save modeling data
`PDFOutputPath`	Supply a path to save model insights to PDF
`TimeUnit`	List the time unit your data is aggregated by. E.g. "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year"

TimeGroups
: Select time aggregations for adding various time aggregated GDL features.

TargetTransformation
: Run AutoTransformationCreate() to find best transformation for the target variable. Tests YeoJohnson, BoxCox, and Asigh (also Asin and Logit for proportion target variables).

Methods
: Choose from "YeoJohnson", "BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", or "Logit". If more than one is selected, the one with the best normalization pearson statistic will be used. Identity is automatically selected and compared.

AnomalyDetection
: NULL for not using the service. Other, provide a list, e.g. AnomalyDetection = list("tstat_high" = 4, tstat_low = -4)

XREGS
: Additional data to use for model development and forecasting. Data needs to be a complete series which means both the historical and forward looking values over the specified forecast window needs to be supplied.

Lags
: Select the periods for all lag variables you want to create. E.g. c(1:5,52) or list("day" = c(1:10), "weeks" = c(1:4))

MA_Periods
: Select the periods for all moving average variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

SD_Periods
: Select the periods for all moving standard deviation variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

Skew_Periods
: Select the periods for all moving skewness variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

Kurt_Periods
: Select the periods for all moving kurtosis variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

Quantile_Periods
: Select the periods for all moving quantiles variables you want to create. E.g. c(1:5,52) or list("day" = c(2:10), "weeks" = c(2:4))

Quantiles_Selected
: Select from the following c("q5","q10","q15","q20","q25","q30","q35","q40","q45","q50","q55","q6

Difference
: Set to TRUE to put the I in ARIMA

FourierTerms
: Set to the max number of pairs

CalendarVariables
: NULL, or select from "second", "minute", "hour", "wday", "mday", "yday", "week", "wom", "isoweek", "month", "quarter", "year"

HolidayVariable
: NULL, or select from "USPublicHolidays", "EasterGroup", "ChristmasGroup", "OtherEcclesticalFeasts"

HolidayLookback
: Number of days in range to compute number of holidays from a given date in the data. If NULL, the number of days are computed for you.

HolidayLags
: Number of lags for the holiday counts

HolidayMovingAverages
: Number of moving averages for holiday counts

TimeTrendVariable
: Set to TRUE to have a time trend variable added to the model. Time trend is numeric variable indicating the numeric value of each record in the time series (by group). Time trend starts at 1 for the earliest point in time and increments by one for each success time point.

`DataTruncate`	Set to TRUE to remove records with missing values from the lags and moving average features created
`ZeroPadSeries`	NULL to do nothing. Otherwise, set to "maxmax", "minmax", "maxmin", "minmin". See `TimeSeriesFill` for explanations of each type
`SplitRatios`	E.g c(0.7,0.2,0.1) for train, validation, and test sets
`TreeMethod`	Choose from "hist", "gpu_hist"
`NThreads`	Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8
`PartitionType`	Select "random" for random data partitioning "time" for partitioning by time frames
`Timer`	Setting to TRUE prints out the forecast number while it is building
`DebugMode`	Setting to TRUE generates printout of all header code comments during run time of function
`EvalMetric`	Select from "r2", "RMSE", "MSE", "MAE"
`LossFunction`	Default is 'reg:squarederror'. Other options include 'reg:squaredlogerror', 'reg:pseudohubererror', 'count:poisson', 'survival:cox', 'survival:aft', 'aft_loss_distribution', 'reg:gamma', 'reg:tweedie'
`GridTune`	Set to TRUE to run a grid tune
`GridEvalMetric`	This is the metric used to find the threshold 'poisson', 'mae', 'mape', 'mse', 'msle', 'kl', 'cs', 'r2'
`ModelCount`	Set the number of models to try in the grid tune
`MaxRunsWithoutNewWinner`	Number of consecutive runs without a new winner in order to terminate procedure
`MaxRunMinutes`	Default 24L*60L
`NTrees`	Select the number of trees you want to have built to train the model
`LearningRate`	Learning Rate
`MaxDepth`	Depth
`MinChildWeight`	Records in leaf
`SubSample`	Random forecast setting
`ColSampleByTree`	Self explanatory

AutoXGBoostClassifier *AutoXGBoostClassifier*

Description

AutoXGBoostClassifier is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoXGBoostClassifier(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
  model_path = NULL,
  metadata_path = NULL,
  SaveInfoToPDF = FALSE,
  ModelID = "FirstModel",
  ReturnFactorLevels = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  Verbose = 0L,
  NumOfParDepPlots = 3L,
  NThreads = max(1L, parallel::detectCores() - 2L),
  LossFunction = "reg:logistic",
  CostMatrixWeights = c(1, 0, 0, 1),
  eval_metric = "auc",
  grid_eval_metric = "MCC",
  TreeMethod = "hist",
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  PassInGrid = NULL,
  Trees = 1000L,
  eta = 0.3,
  max_depth = 9,
  min_child_weight = 1,
  subsample = 1,
```

```
  colsample_bytree = 1,
  DebugMode = FALSE
)
```

Arguments

`data` This is your data set for training and testing your model

`TrainOnFull` Set to TRUE to train on full data

`ValidationData` This is your holdout data set used in modeling either refine your hyperparameters.

`TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

`TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 | 1 numeric variable.

`FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)

`IDcols` A vector of column names or column numbers to keep in your data but not include in the modeling.

`model_path` A character string of your path file to where you want your output saved

`metadata_path` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

`SaveInfoToPDF` Set to TRUE to save modeling information to PDF. If model_path or metadata_path aren't defined then output will be saved to the working directory

`ModelID` A character string to name your model and output

`ReturnFactorLevels` TRUE or FALSE. Set to FALSE to not return factor levels.

`ReturnModelObjects` Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

`SaveModelObjects` Set to TRUE to return all modeling objects to your environment

`Verbose` Set to 0 if you want to suppress model evaluation updates in training

`NumOfParDepPlots` Tell the function the number of partial dependence calibration plots you want to create.

`NThreads` Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8

`LossFunction` Select from 'reg:logistic', "binary:logistic"

`CostMatrixWeights` A vector with 4 elements c(True Positive Cost, False Negative Cost, False Positive Cost, True Negative Cost). Default c(1,0,0,1),

`eval_metric` This is the metric used to identify best grid tuned model. Choose from "logloss","error","aucpr","auc"

`grid_eval_metric` Case sensitive. I typically choose 'Utility' or 'MCC'. Choose from 'Utility', 'MCC', 'Acc', 'F1_Score', 'F2_Score', 'F0.5_Score', 'TPR', 'TNR', 'FNR', 'FPR', 'FDR', 'FOR', 'NPV', 'PPV', 'ThreatScore'

`TreeMethod` Choose from "hist", "gpu_hist"

`GridTune` Set to TRUE to run a grid tuning procedure

`BaselineComparison`
Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

`MaxModelsInGrid`
Number of models to test from grid options.

`MaxRunsWithoutNewWinner`
A number

`MaxRunMinutes` In minutes

`PassInGrid` Default is NULL. Provide a data.table of grid options from a previous run.

`Trees` Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)

`eta` Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

`max_depth` Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)

`min_child_weight`
Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)

`subsample` Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

`colsample_bytree`
Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

`DebugMode` TRUE to print to console the steps taken

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, GridCollect, and GridList

AutoXGBoostHurdleModel *AutoXGBoostHurdleModel*

Description

AutoXGBoostHurdleModel is generalized hurdle modeling framework

Usage

```
AutoXGBoostHurdleModel(
  TreeMethod = "hist",
  TrainOnFull = FALSE,
  PassInGrid = NULL,
  NThreads = max(1L, parallel::detectCores() - 2L),
  ModelID = "ModelTest",
  Paths = NULL,
  MetaDataPaths = NULL,
  data,
  ValidationData = NULL,
  TestData = NULL,
  Buckets = 0L,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
  TransformNumericColumns = NULL,
  SplitRatios = c(0.7, 0.2, 0.1),
  SaveModelObjects = FALSE,
  ReturnModelObjects = TRUE,
  NumOfParDepPlots = 10L,
  GridTune = FALSE,
  grid_eval_metric = "accuracy",
  MaxModelsInGrid = 1L,
  BaselineComparison = "default",
  MaxRunsWithoutNewWinner = 10L,
  MaxRunMinutes = 60L,
 Trees = list(classifier = seq(1000, 2000, 100), regression = seq(1000, 2000, 100)),
 eta = list(classifier = seq(0.05, 0.4, 0.05), regression = seq(0.05, 0.4, 0.05)),
 max_depth = list(classifier = seq(4L, 16L, 2L), regression = seq(4L, 16L, 2L)),
 min_child_weight = list(classifier = seq(1, 10, 1), regression = seq(1, 10, 1)),
 subsample = list(classifier = seq(0.55, 1, 0.05), regression = seq(0.55, 1, 0.05)),
 colsample_bytree = list(classifier = seq(0.55, 1, 0.05), regression = seq(0.55, 1,
    0.05))
)
```

Arguments

`TreeMethod`	Set to hist or gpu_hist depending on if you have an xgboost installation capable of gpu processing
`TrainOnFull`	Set to TRUE to train model on 100 percent of data
`PassInGrid`	Pass in a grid for changing up the parameter settings for catboost
`NThreads`	Set to the number of threads you would like to dedicate to training
`ModelID`	Define a character name for your models
`Paths`	The path to your folder where you want your model information saved
`MetaDataPaths`	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to Paths.
`data`	Source training data. Do not include a column that has the class labels for the buckets as they are created internally.
`ValidationData`	Source validation data. Do not include a column that has the class labels for the buckets as they are created internally.
`TestData`	Souce test data. Do not include a column that has the class labels for the buckets as they are created internally.
`Buckets`	A numeric vector of the buckets used for subsetting the data. NOTE: the final Bucket value will first create a subset of data that is less than the value and a second one thereafter for data greater than the bucket value.
`TargetColumnName`	Supply the column name or number for the target variable
`FeatureColNames`	Supply the column names or number of the features (not included the PrimaryDateColumn)
`IDcols`	Includes PrimaryDateColumn and any other columns you want returned in the validation data with predictions
`TransformNumericColumns`	Transform numeric column inside the AutoCatBoostRegression() function
`SplitRatios`	Supply vector of partition ratios. For example, c(0.70,0.20,0,10).
`SaveModelObjects`	Set to TRUE to save the model objects to file in the folders listed in Paths
`ReturnModelObjects`	Set to TRUE to return all model objects
`NumOfParDepPlots`	Set to pull back N number of partial dependence calibration plots.
`GridTune`	Set to TRUE if you want to grid tune the models
`grid_eval_metric`	Select the metric to optimize in grid tuning. "accuracy", "microauc", "logloss"
`MaxModelsInGrid`	Set to a numeric value for the number of models to try in grid tune
`BaselineComparison`	"default"
`MaxRunsWithoutNewWinner`	Number of runs without a new winner before stopping the grid tuning
`MaxRunMinutes`	Max number of minutes to allow the grid tuning to run for

`Trees` Provide a named list to have different number of trees for each model. Trees = list("classifier" = seq(1000,2000,100), "regression" = seq(1000,2000,100))

`eta` Provide a named list to have different number of eta for each model.

`max_depth` Provide a named list to have different number of max_depth for each model.

`min_child_weight` Provide a named list to have different number of min_child_weight for each model.

`subsample` Provide a named list to have different number of subsample for each model.

`colsample_bytree` Provide a named list to have different number of colsample_bytree for each model.

Value

Returns AutoXGBoostRegression() model objects: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and the grid used

AutoXGBoostMultiClass *AutoXGBoostMultiClass*

Description

AutoXGBoostMultiClass is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, a stratified sampling (by the target variable) is done to create train and validation sets. Then, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation metrics, variable importance, and column names used in model fitting.

Usage

```
AutoXGBoostMultiClass(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
```

```
  model_path = NULL,
  metadata_path = NULL,
  ModelID = "FirstModel",
  LossFunction = "multi:softmax",
  ReturnFactorLevels = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
  Verbose = 0L,
  DebugMode = FALSE,
  NumOfParDepPlots = 3L,
  NThreads = parallel::detectCores(),
  eval_metric = "merror",
  grid_eval_metric = "accuracy",
  TreeMethod = "hist",
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  PassInGrid = NULL,
  Trees = 50L,
  eta = NULL,
  max_depth = NULL,
  min_child_weight = NULL,
  subsample = NULL,
  colsample_bytree = NULL
)
```

Arguments

data	This is your data set for training and testing your model
TrainOnFull	Set to TRUE to train on full data
ValidationData	This is your holdout data set used in modeling either refine your hyperparameters.
TestData	This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.
TargetColumnName	Either supply the target column name OR the column number where the target is located (but not mixed types). Note that the target column needs to be a 0 | 1 numeric variable.
FeatureColNames	Either supply the feature column names OR the column number where the target is located (but not mixed types)
IDcols	A vector of column names or column numbers to keep in your data but not include in the modeling.
model_path	A character string of your path file to where you want your output saved
metadata_path	A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.
ModelID	A character string to name your model and output

LossFunction 'multi:softmax'

ReturnFactorLevels
TRUE or FALSE. Set to FALSE to not return factor levels.

ReturnModelObjects
Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects
Set to TRUE to return all modeling objects to your environment

Verbose Set to 0 if you want to suppress model evaluation updates in training

DebugMode Set to TRUE to get a print out of the steps taken internally

NumOfParDepPlots
Tell the function the number of partial dependence calibration plots you want to create.

NThreads Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8

eval_metric This is the metric used to identify best grid tuned model. Choose from "logloss","error","aucpr","auc"

grid_eval_metric
"accuracy", "logloss", "microauc"

TreeMethod Choose from "hist", "gpu_hist"

GridTune Set to TRUE to run a grid tuning procedure

BaselineComparison
Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

MaxModelsInGrid
Number of models to test from grid options.

MaxRunsWithoutNewWinner
A number

MaxRunMinutes In minutes

PassInGrid Default is NULL. Provide a data.table of grid options from a previous run.

Trees Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)

eta Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

max_depth Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)

min_child_weight
Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)

subsample Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

colsample_bytree
Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvaluationMetrics.csv, GridCollect, GridList, and TargetLevels

Author(s)

Adrian Antico

AutoXGBoostRegression *AutoXGBoostRegression*

Description

AutoXGBoostRegression is an automated XGBoost modeling framework with grid-tuning and model evaluation that runs a variety of steps. First, the function will run a random grid tune over N number of models and find which model is the best (a default model is always included in that set). Once the model is identified and built, several other outputs are generated: validation data with predictions, evaluation plot, evaluation boxplot, evaluation metrics, variable importance, partial dependence calibration plots, partial dependence calibration box plots, and column names used in model fitting.

Usage

```
AutoXGBoostRegression(
  data,
  TrainOnFull = FALSE,
  ValidationData = NULL,
  TestData = NULL,
  TargetColumnName = NULL,
  FeatureColNames = NULL,
  IDcols = NULL,
  model_path = NULL,
  metadata_path = NULL,
  DebugMode = FALSE,
  SaveInfoToPDF = FALSE,
  ModelID = "FirstModel",
  ReturnFactorLevels = TRUE,
  ReturnModelObjects = TRUE,
  SaveModelObjects = FALSE,
```

```
  TransformNumericColumns = NULL,
  Methods = c("BoxCox", "Asinh", "Log", "LogPlus1", "Sqrt", "Asin", "Logit"),
  Verbose = 0L,
  NumOfParDepPlots = 3L,
  NThreads = parallel::detectCores(),
  LossFunction = "reg:squarederror",
  eval_metric = "rmse",
  grid_eval_metric = "r2",
  TreeMethod = "hist",
  GridTune = FALSE,
  BaselineComparison = "default",
  MaxModelsInGrid = 10L,
  MaxRunsWithoutNewWinner = 20L,
  MaxRunMinutes = 24L * 60L,
  PassInGrid = NULL,
  Trees = 50L,
  eta = NULL,
  max_depth = NULL,
  min_child_weight = NULL,
  subsample = NULL,
  colsample_bytree = NULL
)
```

Arguments

`data` This is your data set for training and testing your model

`TrainOnFull` Set to TRUE to train on full data

`ValidationData` This is your holdout data set used in modeling either refine your hyperparameters.

`TestData` This is your holdout data set. Catboost using both training and validation data in the training process so you should evaluate out of sample performance with this data set.

`TargetColumnName` Either supply the target column name OR the column number where the target is located (but not mixed types).

`FeatureColNames` Either supply the feature column names OR the column number where the target is located (but not mixed types)

`IDcols` A vector of column names or column numbers to keep in your data but not include in the modeling.

`model_path` A character string of your path file to where you want your output saved

`metadata_path` A character string of your path file to where you want your model evaluation output saved. If left NULL, all output will be saved to model_path.

`DebugMode` Set to TRUE to get a print out of the steps taken throughout the function

`SaveInfoToPDF` Set to TRUE to save model insights to pdf

`ModelID` A character string to name your model and output

`ReturnFactorLevels` Set to TRUE to have the factor levels returned with the other model objects

`ReturnModelObjects` Set to TRUE to output all modeling objects (E.g. plots and evaluation metrics)

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

TransformNumericColumns
: Set to NULL to do nothing; otherwise supply the column names of numeric variables you want transformed

Methods
: Choose from "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Sqrt", "Logit", "YeoJohnson". Function will determine if one cannot be used because of the underlying data.

Verbose
: Set to 0 if you want to suppress model evaluation updates in training

NumOfParDepPlots
: Tell the function the number of partial dependence calibration plots you want to create.

NThreads
: Set the maximum number of threads you'd like to dedicate to the model run. E.g. 8

LossFunction
: Default is 'reg:squarederror'. Other options include 'reg:squaredlogerror', 'reg:pseudohubererror', 'count:poisson', 'survival:cox', 'survival:aft', 'aft_loss_distribution', 'reg:gamma', 'reg:tweedie'

eval_metric
: This is the metric used to identify best grid tuned model. Choose from "r2", "RMSE", "MSE", "MAE"

grid_eval_metric
: "mae", "mape", "rmse", "r2". Case sensitive

TreeMethod
: Choose from "hist", "gpu_hist"

GridTune
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

BaselineComparison
: Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

MaxModelsInGrid
: Number of models to test from grid options (243 total possible options)

MaxRunsWithoutNewWinner
: Runs without new winner to end procedure

MaxRunMinutes
: In minutes

PassInGrid
: Default is NULL. Provide a data.table of grid options from a previous run.

Trees
: Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the trees numbers you want to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1000L, 10000L, 1000L)

eta
: Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

max_depth
: Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)

min_child_weight
: Number, or vector for min_child_weight to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)

`subsample` Number, or vector for subsample to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

`colsample_bytree` Number, or vector for colsample_bytree to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(0.55, 1.0, 0.05)

Value

Saves to file and returned in list: VariableImportance.csv, Model, ValidationData.csv, EvalutionPlot.png, EvalutionBoxPlot.png, EvaluationMetrics.csv, ParDepPlots.R a named list of features with partial dependence calibration plots, ParDepBoxPlots.R, GridCollect, and GridList

AutoXGBoostScoring *AutoXGBoostScoring*

Description

AutoXGBoostScoring is an automated scoring function that compliments the AutoCatBoost model training functions. This function requires you to supply features for scoring. It will run ModelDataPrep() and the DummifyDT() function to prepare your features for xgboost data conversion and scoring.

Usage

```
AutoXGBoostScoring(
  TargetType = NULL,
  ScoringData = NULL,
  ReturnShapValues = FALSE,
  FeatureColumnNames = NULL,
  IDcols = NULL,
  FactorLevelsList = NULL,
  TargetLevels = NULL,
```

```
  Objective = "multi:softmax",
  OneHot = FALSE,
  ModelObject = NULL,
  ModelPath = NULL,
  ModelID = NULL,
  ReturnFeatures = TRUE,
  TransformNumeric = FALSE,
  BackTransNumeric = FALSE,
  TargetColumnName = NULL,
  TransformationObject = NULL,
  TransID = NULL,
  TransPath = NULL,
  MDP_Impute = TRUE,
  MDP_CharToFactor = TRUE,
  MDP_RemoveDates = TRUE,
  MDP_MissFactor = "0",
  MDP_MissNum = -1
)
```

Arguments

`TargetType` Set this value to "regression", "classification", or "multiclass" to score models built using AutoCatBoostRegression(), AutoCatBoostClassify() or AutoCatBoostMultiClass().

`ScoringData` This is your data.table of features for scoring. Can be a single row or batch.

`ReturnShapValues` Set to TRUE to return shap values for the predicted values

`FeatureColumnNames` Supply either column names or column numbers used in the AutoXGBoost__() function

`IDcols` Supply ID column numbers for any metadata you want returned with your predicted values

`FactorLevelsList` Supply the factor variables' list from DummifyDT()

`TargetLevels` Supply the target levels output from AutoXGBoostMultiClass() or the scoring function will go looking for it in the file path you supply.

`Objective` Set to 'multi:softprobs' if you did so in training. Default is softmax

`OneHot` Set to TRUE to have one-hot-encoding run. Otherwise, N columns will be made for N levels of a factor variable

`ModelObject` Supply a model for scoring, otherwise it will have to search for it in the file path you specify

`ModelPath` Supply your path file used in the AutoXGBoost__() function

`ModelID` Supply the model ID used in the AutoXGBoost__() function

`ReturnFeatures` Set to TRUE to return your features with the predicted values.

`TransformNumeric` Set to TRUE if you have features that were transformed automatically from an Auto__Regression() model AND you haven't already transformed them.

`BackTransNumeric` Set to TRUE to generate back-transformed predicted values. Also, if you return features, those will also be back-transformed.

TargetColumnName
: Input your target column name used in training if you are utilizing the transformation service

TransformationObject
: Set to NULL if you didn't use transformations or if you want the function to pull from the file output from the Auto__Regression() function. You can also supply the transformation data.table object with the transformation details versus having it pulled from file.

TransID
: Set to the ID used for saving the transformation data.table object or set it to the ModelID if you are pulling from file from a build with Auto__Regression().

TransPath
: Set the path file to the folder where your transformation data.table detail object is stored. If you used the Auto__Regression() to build, set it to the same path as ModelPath.

MDP_Impute
: Set to TRUE if you did so for modeling and didn't do so before supplying ScoringData in this function

MDP_CharToFactor
: Set to TRUE to turn your character columns to factors if you didn't do so to your ScoringData that you are supplying to this function

MDP_RemoveDates
: Set to TRUE if you have date of timestamp columns in your ScoringData

MDP_MissFactor
: If you set MDP_Impute to TRUE, supply the character values to replace missing values with

MDP_MissNum
: If you set MDP_Impute to TRUE, supply a numeric value to replace missing values with

Value

A data.table of predicted values with the option to return model features as well.

BNLearnArcStrength *BNLearnArcStrength*

Description

Utilize bnlearn to create a bayesian network and return the arc strengths for features and their edges

Usage

```
BNLearnArcStrength(
  data = NULL,
  NetworkVars = NULL,
  DataSampleRate = 0.5,
  ByGroupVars = NULL,
  MinRows = 30
)
```

Arguments

data	data.table
NetworkVars	Names of the columns to utilize in the analysis
DataSampleRate	Sample your data to reduce runtime
ByGroupVars	Group variables that you want to have the analysis done by
MinRows	Minimum number of rows to utilize in the ByGroupVars analysis

ChartTheme *ChartTheme*

Description

This function helps your ggplots look professional with the choice of the two main colors that will dominate the theme

Usage

```
ChartTheme(
  Size = 12,
  AngleX = 35,
  AngleY = 0,
  ChartColor = "lightsteelblue1",
  BorderColor = "darkblue",
  TextColor = "darkblue",
  GridColor = "white",
  BackGroundColor = "gray95",
  LegendPosition = "bottom"
)
```

Arguments

`Size`	The size of the axis labels and title
`AngleX`	The angle of the x axis labels
`AngleY`	The angle of the Y axis labels
`ChartColor`	"lightsteelblue1",
`BorderColor`	"darkblue",
`TextColor`	"darkblue",
`GridColor`	"white",
`BackGroundColor`	"gray95",
`LegendPosition`	Where to place legend

Value

An object to pass along to ggplot objects following the "+" sign

)
```

Arguments

`data` data object

`PartitionRatios`
Requires three values for train, validation, and test data sets

`BaseFunnelMeasure`
E.g. "Leads". This value should be a forward looking variable. Say you want to forecast ConversionMeasure 2 months into the future. You should have two months into the future of values of BaseFunnelMeasure

`ConversionMeasure`
E.g. "Conversions". Rate is derived as conversions over leads by cohort periods out

ConversionRateMeasure
: Conversions over Leads for every cohort

CohortPeriodsVariable
: Numeric. Numerical value of the the number of periods since cohort base date.

CalendarDate
: The name of your date column that represents the calendar date

CohortDate
: The name of your date column that represents the cohort date

TruncateDate
: NULL. Supply a date to represent the earliest point in time you want in your data. Filtering takes place before partitioning data so feature engineering can include as many non null values as possible.

TimeUnit
: Base time unit of data. "days", "weeks", "months", "quarters", "years"

CalendarTimeGroups
: TimeUnit value must be included. If you want to generate lags and moving averages in several time based aggregations, choose from "days", "weeks", "months", "quarters", "years".

CohortTimeGroups
: TimeUnit value must be included. If you want to generate lags and moving averages in several time based aggregations, choose from "days", "weeks", "months", "quarters", "years".

TransformTargetVariable
: TRUE or FALSe

TransformMethods
: Choose from "Identity", "BoxCox", "Asinh", "Asin", "Log", "LogPlus1", "Logit", "YeoJohnson"

AnomalyDetection
: Provide a named list. See examples

Jobs
: Default is "eval" and "train"

SaveModelObjects
: Set to TRUE to return all modeling objects to your environment

ModelID
: A character string to name your model and output

ModelPath
: Path to where you want your models saved

MetaDataPath
: Path to where you want your metadata saved. If NULL, function will try ModelPath if it is not NULL.

TaskType
: "GPU" or "CPU" for catboost training

NumGPUs
: Number of GPU's you would like to utilize

DT_Threads
: Number of threads to use for data.table. Default is Total - 2

EvaluationMetric
: This is the metric used inside catboost to measure performance on validation data during a grid-tune. "RMSE" is the default, but other options include: "MAE", "MAPE", "Poisson", "Quantile", "LogLinQuantile", "Lq", "NumErrors", "SMAPE", "R2", "MSLE", "MedianAbsoluteError".

LossFunction
: Used in model training for model fitting. Select from 'RMSE', 'MAE', 'Quantile', 'LogLinQuantile', 'MAPE', 'Poisson', 'PairLogitPairwise', 'Tweedie', 'QueryRMSE'

NumOfParDepPlots
: Number of partial dependence plots to return

MetricPeriods
: Number of trees to build before the internal catboost eval step happens

CalendarVariables
: "wday", "mday", "yday", "week", "isoweek", "month", "quarter", "year"

HolidayGroups c("USPublicHolidays","EasterGroup","ChristmasGroup","OtherEcclesticalFeasts")

HolidayLookback
: Number of days in range to compute number of holidays from a given date in the data. If NULL, the number of days are computed for you.

ImputeRollStats
: Constant value to fill NA after running AutoLagRollStats()

CohortHolidayLags
: c(1L, 2L, 7L),

CohortHolidayMovingAverages
: c(3L, 7L),

CalendarHolidayLags
: c(1L, 2L, 7L),

CalendarHolidayMovingAverages
: = c(3L, 7L),

CalendarLags List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CalendarMovingAverages
: List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CalendarStandardDeviations
: List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CalendarSkews List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CalendarKurts List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CalendarQuantiles
: List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CalendarQuantilesSelected
: Supply a vector of "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"

CohortLags List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CohortMovingAverages
: List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CohortStandardDeviations
: List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CohortSkews List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CohortKurts List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

CohortQuantiles
: List of the form list("day" = c(1L, 7L, 21L), "week" = c(1L, 4L, 52L), "month" = c(1L, 6L, 12L))

`CohortQuantilesSelected`
: Supply a vector of "q5", "q10", "q15", "q20", "q25", "q30", "q35", "q40", "q45", "q50", "q55", "q60", "q65", "q70", "q75", "q80", "q85", "q90", "q95"

`PassInGrid`
: Defaults to NULL. Pass in a single row of grid from a previous output as a data.table (they are collected as data.tables)

`GridTune`
: Set to TRUE to run a grid tuning procedure. Set a number in MaxModelsInGrid to tell the procedure how many models you want to test.

`BaselineComparison`
: Set to either "default" or "best". Default is to compare each successive model build to the baseline model using max trees (from function args). Best makes the comparison to the current best model.

`MaxModelsInGrid`
: Number of models to test from grid options

`MaxRunMinutes`
: Maximum number of minutes to let this run

`MaxRunsWithoutNewWinner`
: Number of models built before calling it quits

`Trees`
: Bandit grid partitioned. The maximum number of trees you want in your models

`Depth`
: Bandit grid partitioned. Number, or vector for depth to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(4L, 16L, 2L)

`LearningRate`
: Bandit grid partitioned. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the LearningRate values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.01,0.02,0.03,0.04)

`L2_Leaf_Reg`
: Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the L2_Leaf_Reg values to test. For running grid tuning, a NULL value supplied will mean these values are tested seq(1.0, 10.0, 1.0)

`RSM`
: CPU only. Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the RSM values to test. For running grid tuning, a NULL value supplied will mean these values are tested c(0.80, 0.85, 0.90, 0.95, 1.0)

`BootStrapType`
: Random testing. Supply a single value for non-grid tuning cases. Otherwise, supply a vector for the BootStrapType values to test. For running grid tuning, a NULL value supplied will mean these values are tested c("Bayesian", "Bernoulli", "Poisson", "MVS", "No")

`GrowPolicy`
: Random testing. NULL, character, or vector for GrowPolicy to test. For grid tuning, supply a vector of values. For running grid tuning, a NULL value supplied will mean these values are tested c("SymmetricTree", "Depthwise", "Lossguide")

Value

Saves metadata and models to files of your choice. Also returns metadata and models from the function. User specifies both options.

## End(Not run)
```

CreateCalendarVariables *CreateCalendarVariables*

Description

CreateCalendarVariables Rapidly creates calendar variables based on the date column you provide

Usage

```
CreateCalendarVariables(
  data,
  DateCols = NULL,
  AsFactor = FALSE,
  TimeUnits = "wday"
)
```

Arguments

data	This is your data
DateCols	Supply either column names or column numbers of your date columns you want to use for creating calendar variables
AsFactor	Set to TRUE if you want factor type columns returned; otherwise integer type columns will be returned
TimeUnits	Supply a character vector of time units for creating calendar variables. Options include: "second", "minute", "hour", "wday", "mday", "yday", "week", "isoweek", "wom" (week of month), "month", "quarter", "year"

Value

Returns your data.table with the added calendar variables at the end

CreateHolidayVariables

CreateHolidayVariables

Description

CreateHolidayVariables Rapidly creates holiday count variables based on the date columns you provide

Usage

```
CreateHolidayVariables(
  data,
  DateCols = NULL,
  LookbackDays = NULL,
  HolidayGroups = c("USPublicHolidays", "EasterGroup", "ChristmasGroup",
    "OtherEcclesticalFeasts"),
  Holidays = NULL,
  Print = FALSE
)
```

Arguments

data	This is your data
DateCols	Supply either column names or column numbers of your date columns you want to use for creating calendar variables
LookbackDays	Default NULL which investigates Date - Lag1Date to compute Holiday's per period. Otherwise it will lookback LokkbackDays.
HolidayGroups	Pick groups

Holidays	Pick holidays
Print	Set to TRUE to print iteration number to console

Value

Returns your data.table with the added holiday indicator variable

head(data)
print(runtime)
```

```
## End(Not run)
```

DummifyDT *DummifyDT*

Description

DummifyDT creates dummy variables for the selected columns. Either one-hot encoding, N+1 columns for N levels, or N columns for N levels.

Usage

```
DummifyDT(
  data,
  cols,
  TopN = NULL,
  KeepFactorCols = FALSE,
  OneHot = FALSE,
  SaveFactorLevels = FALSE,
  SavePath = NULL,
  ImportFactorLevels = FALSE,
  FactorLevelsList = NULL,
  ClustScore = FALSE,
  ReturnFactorLevels = FALSE,
  GroupVar = FALSE
)
```

Arguments

`data`	The data set to run the micro auc on
`cols`	A vector with the names of the columns you wish to dichotomize
`TopN`	Default is NULL. Scalar to apply to all categorical columns or a vector to apply to each categorical variable. Only create dummy variables for the TopN number of levels. Will be either TopN or max(levels)
`KeepFactorCols`	Set to TRUE to keep the original columns used in the dichotomization process
`OneHot`	Set to TRUE to run one hot encoding, FALSE to generate N columns for N levels
`SaveFactorLevels`	Set to TRUE to save unique levels of each factor column to file as a csv
`SavePath`	Provide a file path to save your factor levels. Use this for models that you have to create dummy variables for.
`ImportFactorLevels`	Instead of using the data you provide, import the factor levels csv to ensure you build out all of the columns you trained with in modeling.
`FactorLevelsList`	Supply a list of factor variable levels
`ClustScore`	This is for scoring AutoKMeans. It converts the added dummy column names to conform with H2O dummy variable naming convention

ReturnFactorLevels
: If you want a named list of all the factor levels returned, set this to TRUE. Doing so will cause the function to return a list with the source data.table and the list of factor variables' levels

GroupVar
: Ignore this

Value

Either a data table with new dummy variables columns and optionally removes base columns (if ReturnFactorLevels is FALSE), otherwise a list with the data.table and a list of the factor levels.

```

EvalPlot *EvalPlot*

Description

This function automatically builds calibration plots and calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```
EvalPlot(
  data,
  PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"),
  GraphType = c("calibration"),
  PercentileBucket = 0.05,
  aggrfun = function(x) mean(x, na.rm = TRUE)
)
```

Arguments

data	Data containing predicted values and actual values for comparison
PredictionColName	String representation of column name with predicted values from model
TargetColName	String representation of column name with target values from model
GraphType	Calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation
PercentileBucket	Number of buckets to partition the space on (0,1) for evaluation
aggrfun	The statistics function used in aggregation, listed as a function

Value

Calibration plot or boxplot

## End(Not run)
```

FakeDataGenerator *FakeDataGenerator*

Description

Create fake data for examples

Usage

```
FakeDataGenerator(
  Correlation = 0.7,
  N = 1000L,
  ID = 5L,
  FactorCount = 2L,
  AddDate = TRUE,
  AddComment = FALSE,
  ZIP = 5L,
  TimeSeries = FALSE,
  TimeSeriesTimeAgg = "day",
  ChainLadderData = FALSE,
  Classification = FALSE,
  MultiClass = FALSE
)
```

Arguments

Correlation	Set the correlation value for simulated data
N	Number of records
ID	Number of IDcols to include
FactorCount	Number of factor type columns to create
AddDate	Set to TRUE to include a date column
AddComment	Set to TRUE to add a comment column
ZIP	Zero Inflation Model target variable creation. Select from 0 to 5 to create that number of distinctly distributed data, stratifed from small to large
TimeSeries	For testing AutoBanditSarima
TimeSeriesTimeAgg	Choose from "1min", "5min", "10min", "15min", "30min", "hour", "day", "week", "month", "quarter", "year",
ChainLadderData	Set to TRUE to return Chain Ladder Data for using AutoMLChainLadderTrainer
Classification	Set to TRUE to build classification data
MultiClass	Set to TRUE to build MultiClass data

Author(s)

Adrian Antico

Examples

```
## Not run:
data <- RemixAutoML::FakeDataGenerator(
   Correlation = 0.70,

```

```
    TimeSeries = FALSE,
    ChainLadderData = FALSE,
    Classification = FALSE,
    MultiClass = FALSE)

## End(Not run)
```

GenTSAnomVars *GenTSAnomVars*

Description

GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure. Data is z-scaled and grouped by factors and time periods to determine which points are above and below the control limits in a cumulative time fashion. Then a cumulative rate is created as the final variable. Set KeepAllCols to FALSE to utilize the intermediate features to create rolling stats from them. The anomalies are separated into those that are extreme on the positive end versus those that are on the negative end.

Usage

```
GenTSAnomVars(
  data,
  ValueCol = "Value",
  GroupVars = NULL,
  DateVar = "DATE",
  HighThreshold = 1.96,
  LowThreshold = -1.96,
  KeepAllCols = TRUE,
  IsDataScaled = FALSE
)
```

Arguments

`data`	the source residuals data.table
`ValueCol`	the numeric column to run anomaly detection over
`GroupVars`	this is a group by variable
`DateVar`	this is a time variable for grouping
`HighThreshold`	this is the threshold on the high end
`LowThreshold`	this is the threshold on the low end
`KeepAllCols`	set to TRUE to remove the intermediate features
`IsDataScaled`	set to TRUE if you already scaled your data

Value

The original data.table with the added columns merged in. When KeepAllCols is set to FALSE, you will get back two columns: AnomHighRate and AnomLowRate - these are the cumulative anomaly rates over time for when you get anomalies from above the thresholds (e.g. 1.96) and below the thresholds.

  HighThreshold = 1.96,
  LowThreshold = -1.96,
  KeepAllCols = TRUE,
  IsDataScaled  = FALSE)

## End(Not run)
```

H2OAutoencoder *H2OAutoencoder*

Description

H2OAutoencoder for anomaly detection and or dimensionality reduction

Usage

```
H2OAutoencoder(
  AnomalyDetection = FALSE,
  DimensionReduction = TRUE,
  data,
  Features = NULL,
  RemoveFeatures = FALSE,
  NThreads = max(1L, parallel::detectCores() - 2L),
```

```
  MaxMem = "28G",
  H2OStart = TRUE,
  H2OShutdown = TRUE,
  ModelID = "TestModel",
  model_path = NULL,
  LayerStructure = NULL,
  NodeShrinkRate = (sqrt(5) - 1)/2,
  ReturnLayer = 4L,
  per_feature = TRUE,
  Activation = "Tanh",
  Epochs = 5L,
  L2 = 0.1,
  ElasticAveraging = TRUE,
  ElasticAveragingMovingRate = 0.9,
  ElasticAveragingRegularization = 0.001
)
```

Arguments

AnomalyDetection	Set to TRUE to run anomaly detection
DimensionReduction	Set to TRUE to run dimension reduction
data	The data.table with the columns you wish to have analyzed
Features	NULL Column numbers or column names
RemoveFeatures	Set to TRUE if you want the features you specify in the Features argument to be removed from the data returned
NThreads	max(1L, parallel::detectCores()-2L)
MaxMem	"28G"
H2OStart	TRUE to start H2O inside the function
H2OShutdown	Setting to TRUE will shutdown H2O when it done being used internally.
ModelID	"TestModel"
model_path	If NULL no model will be saved. If a valid path is supplied the model will be saved there
LayerStructure	If NULL, layers and sizes will be created for you, using NodeShrinkRate and 7 layers will be created.
NodeShrinkRate	= (sqrt(5) - 1) / 2,
ReturnLayer	Which layer of the NNet to return. Choose from 1-7 with 4 being the layer with the least amount of nodes
per_feature	Set to TRUE to have per feature anomaly detection generated. Otherwise and overall value will be generated
Activation	Choose from "Tanh", "TanhWithDropout", "Rectifier", "RectifierWithDropout","Maxout", "MaxoutWithDropout"
Epochs	Quantile value to find the cutoff value for classifying outliers
L2	Specify the amount of memory to allocate to H2O. E.g. "28G"
ElasticAveraging	Specify the number of threads (E.g. cores * 2)

ElasticAveragingMovingRate
: Specify the number of decision trees to build

ElasticAveragingRegularization
: Specify the row sample rate per tree

Value

A data.table

H2OAutoencoderScoring *H2OAutoencoderScoring*

Description

H2OAutoencoderScoring for anomaly detection and or dimensionality reduction

Usage

```
H2OAutoencoderScoring(
  data,
  Features = NULL,
  RemoveFeatures = FALSE,
  ModelObject = NULL,
  AnomalyDetection = TRUE,
  DimensionReduction = TRUE,
  ReturnLayer = 4L,
  per_feature = TRUE,
  NThreads = max(1L, parallel::detectCores() - 2L),
  MaxMem = "28G",
  H2OStart = TRUE,
  H2OShutdown = TRUE,
  ModelID = "TestModel",
  model_path = NULL
)
```

Arguments

`data`	The data.table with the columns you wish to have analyzed
`Features`	NULL Column numbers or column names
`RemoveFeatures`	Set to TRUE if you want the features you specify in the Features argument to be removed from the data returned
`ModelObject`	If NULL then the model will be loaded from file. Otherwise, it will use what is supplied
`AnomalyDetection`	Set to TRUE to run anomaly detection
`DimensionReduction`	Set to TRUE to run dimension reduction
`ReturnLayer`	Which layer of the NNet to return. Choose from 1-7 with 4 being the layer with the least amount of nodes

per_feature	Set to TRUE to have per feature anomaly detection generated. Otherwise and overall value will be generated
NThreads	max(1L, parallel::detectCores()-2L)

## End(Not run)
```

H2OIsolationForest *H2OIsolationForest*

Description

H2OIsolationForestScoring for dimensionality reduction and / or anomaly detection

Usage

```
H2OIsolationForest(
  data,
  Features = NULL,
  IDcols = NULL,
  ModelID = "TestModel",
  SavePath = NULL,
  Threshold = 0.975,
  MaxMem = "28G",
  NThreads = -1,
  NTrees = 100,
  MaxDepth = 8,
  MinRows = 1,
  RowSampleRate = (sqrt(5) - 1)/2,
  ColSampleRate = 1,
  ColSampleRatePerLevel = 1,
  ColSampleRatePerTree = 1,
  CategoricalEncoding = c("AUTO"),
  Debug = FALSE
)
```

Arguments

data	The data.table with the columns you wish to have analyzed
Features	A character vector with the column names to utilize in the isolation forest
IDcols	A character vector with the column names to not utilize in the isolation forest but have returned with the data output. Otherwise those columns will be removed
ModelID	Name for model that gets saved to file if SavePath is supplied and valid
SavePath	Path directory to store saved model
Threshold	Quantile value to find the cutoff value for classifying outliers
MaxMem	Specify the amount of memory to allocate to H2O. E.g. "28G"
NThreads	Specify the number of threads (E.g. cores * 2)

NTrees	Specify the number of decision trees to build
MaxDepth	Max tree depth
MinRows	Minimum number of rows allowed per leaf
RowSampleRate	Number of rows to sample per tree
ColSampleRate	Sample rate for each split
ColSampleRatePerLevel	Sample rate for each level
ColSampleRatePerTree	Sample rate per tree
CategoricalEncoding	Choose from "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"
Debug	Debugging

Value

Source data.table with predictions. Note that any columns not listed in Features nor IDcols will not be returned with data. If you want columns returned but not modeled, supply them as IDcols

H2OIsolationForestScoring

H2OIsolationForestScoring

Description

H2OIsolationForestScoring for dimensionality reduction and / or anomaly detection scoring on new data

Usage

```
H2OIsolationForestScoring(
  data,
  Features = NULL,
  IDcols = NULL,
  H2OStart = TRUE,
  H2OShutdown = TRUE,
  ModelID = "TestModel",
  SavePath = NULL,
  Threshold = 0.975,
  MaxMem = "28G",
  NThreads = -1,
  Debug = FALSE
)
```

Arguments

`data`	The data.table with the columns you wish to have analyzed
`Features`	A character vector with the column names to utilize in the isolation forest
`IDcols`	A character vector with the column names to not utilize in the isolation forest but have returned with the data output. Otherwise those columns will be removed
`H2OStart`	TRUE to have H2O started inside function
`H2OShutdown`	TRUE to shutdown H2O inside function
`ModelID`	Name for model that gets saved to file if SavePath is supplied and valid
`SavePath`	Path directory to store saved model
`Threshold`	Quantile value to find the cutoff value for classifying outliers
`MaxMem`	Specify the amount of memory to allocate to H2O. E.g. "28G"
`NThreads`	Specify the number of threads (E.g. cores * 2)
`Debug`	Debugging

Value

Source data.table with predictions. Note that any columns not listed in Features nor IDcols will not be returned with data. If you want columns returned but not modeled, supply them as IDcols

ModelDataPrep *ModelDataPrep*

Description

This function replaces inf values with NA, converts characters to factors, and imputes with constants

Usage

```
ModelDataPrep(
  data,
  Impute = TRUE,
  CharToFactor = TRUE,
  FactorToChar = FALSE,
  IntToNumeric = TRUE,
  LogicalToBinary = FALSE,
  DateToChar = FALSE,
  IDateConversion = FALSE,
  RemoveDates = FALSE,
  MissFactor = "0",
  MissNum = -1,
  IgnoreCols = NULL
)
```

Arguments

`data`	This is your source data you'd like to modify
`Impute`	Defaults to TRUE which tells the function to impute the data
`CharToFactor`	Defaults to TRUE which tells the function to convert characters to factors
`FactorToChar`	Converts to character
`IntToNumeric`	Defaults to TRUE which tells the function to convert integers to numeric
`LogicalToBinary`	Converts logical values to binary numeric values
`DateToChar`	Converts date columns into character columns
`IDateConversion`	Convert IDateTime to POSIXct and IDate to Date types
`RemoveDates`	Defaults to FALSE. Set to TRUE to remove date columns from your data.table
`MissFactor`	Supply the value to impute missing factor levels
`MissNum`	Supply the value to impute missing numeric values
`IgnoreCols`	Supply column numbers for columns you want the function to ignore

Value

Returns the original data table with corrected values

`multiplot` *multiplot*

Description

Sick of copying this one into your code? Well, not anymore.

Usage

```
multiplot(..., plotlist = NULL, cols = 2, layout = NULL)
```

Arguments

`...`	Passthrough arguments
`plotlist`	This is the list of your charts
`cols`	This is the number of columns in your multiplot
`layout`	Leave NULL

Value

Multiple ggplots on a single image

## End(Not run)
```

`ParDepCalPlots` *ParDepCalPlots*

Description

This function automatically builds partial dependence calibration plots and partial dependence calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

Usage

```
ParDepCalPlots(
  data,
  PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"),
  IndepVar = c("Independent_Variable_Name"),
  GraphType = c("calibration"),
  PercentileBucket = 0.05,
  FactLevels = 10,
  Function = function(x) mean(x, na.rm = TRUE)
)
```

Arguments

`data`	Data containing predicted values and actual values for comparison
`PredictionColName`	Predicted values column names
`TargetColName`	Target value column names
`IndepVar`	Independent variable column names
`GraphType`	calibration or boxplot - calibration aggregated data based on summary statistic; boxplot shows variation
`PercentileBucket`	Number of buckets to partition the space on (0,1) for evaluation
`FactLevels`	The number of levels to show on the chart (1. Levels are chosen based on frequency; 2. all other levels grouped and labeled as "Other")
`Function`	Supply the function you wish to use for aggregation.

Value

Partial dependence calibration plot or boxplot

  Function = function(x) mean(x, na.rm = TRUE))

## End(Not run)
```

PlotGUI *PlotGUI*

Description

Spin up the esquisse plotting gui

Usage

```
PlotGUI()
```

PrintToPDF *PrintToPDF*

Description

PrintToPDF

Usage

```
PrintToPDF(
  Path,
  OutputName,
  ObjectList = NULL,
  Tables = FALSE,
  MaxPages = 500,
  Title = "Model Output",
  Width = 12,
  Height = 7,
  Paper = "USr",
  BackgroundColor = "transparent",
  ForegroundColor = "black"
)
```

Arguments

`Path`	Path file to the location where you want your pdf saved
`OutputName`	Supply a name for the file you want saved
`ObjectList`	List of objects to print to pdf
`Tables`	TRUE for data tables, FALSE for plots
`MaxPages`	Default of 500
`Title`	The title of the pdf
`Width`	Default is 12
`Height`	Default is 7
`Paper`	'USr' for landscape. 'special' means that Width and Height are used to determine page size
`BackgroundColor`	Default is 'transparent'
`ForegroundColor`	Default is 'black'

Author(s)

Adrian Antico

RedYellowGreen *RedYellowGreen*

Description

This function will find the optimial thresholds for applying the main label and for finding the optimial range for doing nothing when you can quantity the cost of doing nothing

Usage

```
RedYellowGreen(
  data,
  PredictColNumber = 2,
  ActualColNumber = 1,
  TruePositiveCost = 0,
  TrueNegativeCost = 0,
  FalsePositiveCost = -10,
  FalseNegativeCost = -50,
  MidTierCost = -2,
  Cores = 8,
  Precision = 0.01,
  Boundaries = c(0.05, 0.75)
)
```

Arguments

`data`	data is the data table with your predicted and actual values from a classification model
`PredictColNumber`	The column number where the prediction variable is located (in binary form)
`ActualColNumber`	The column number where the target variable is located
`TruePositiveCost`	This is the utility for generating a true positive prediction
`TrueNegativeCost`	This is the utility for generating a true negative prediction
`FalsePositiveCost`	This is the cost of generating a false positive prediction
`FalseNegativeCost`	This is the cost of generating a false negative prediction
`MidTierCost`	This is the cost of doing nothing (or whatever it means to not classify in your case)
`Cores`	Number of cores on your machine
`Precision`	Set the decimal number to increment by between 0 and 1

Boundaries — Supply a vector of two values c(lower bound, upper bound) where the first value is the smallest threshold you want to test and the second value is the largest value you want to test. Note, if your results are at the boundaries you supplied, you should extent the boundary that was reached until the values is within both revised boundaries.

Value

A data table with all evaluated strategies, parameters, and utilities, along with a 3d scatterplot of the results

Author(s)

Adrian Antico

  Cores = 1,
  Boundaries = c(0.05,0.75))

## End(Not run)
```

ResidualOutliers *ResidualOutliers*

Description

ResidualOutliers is an automated time series outlier detection function that utilizes tsoutliers and auto.arima. It looks for five types of outliers: "AO" Additive outliter - a singular extreme outlier that surrounding values aren't affected by; "IO" Innovational outlier - Initial outlier with subsequent anomalous values; "LS" Level shift - An initial outlier with subsequent observations being shifted by some constant on average; "TC" Transient change - initial outlier with lingering effects that dissapate exponentially over time; "SLS" Seasonal level shift - similar to level shift but on a seasonal scale.

Usage

```
ResidualOutliers(
  data,
  DateColName = "DateTime",
  TargetColName = "Target",
  PredictedColName = NULL,
  TimeUnit = "day",
  Lags = 5,
  MA = 5,
  SLags = 0,
  SMA = 0,
  tstat = 2
)
```

Arguments

`data`	the source residuals data.table
`DateColName`	The name of your data column to use in reference to the target variable
`TargetColName`	The name of your target variable column
`PredictedColName`	The name of your predicted value column. If you supply this, you will run anomaly detection of the difference between the target variable and your predicted value. If you leave PredictedColName NULL then you will run anomaly detection over the target variable.
`TimeUnit`	The time unit of your date column: hour, day, week, month, quarter, year
`Lags`	the largest lag or moving average (seasonal too) values for the arima fit
`MA`	Max moving average
`SLags`	Max seasonal lags
`SMA`	Max seasonal moving averages
`tstat`	the t-stat value for tsoutliers

Value

A named list containing FullData = original data.table with outliers data and ARIMA_MODEL = the arima model.

## End(Not run)
```

ROCPlot *ROCPlot*

Description

Internal usage for classification methods. Returns an ROC plot

Usage

```
ROCPlot(
  data = ValidationData,
  TargetName = TargetColumnName,
  SavePlot = SaveModelObjects,
  Name = ModelID,
  metapath = metadata_path,
  modelpath = model_path
)
```

Arguments

data	validation data
TargetName	Target variable name
SavePlot	TRUE or FALSE
Name	Name for saving
metapath	Passthrough
modelpath	Passthrough

Value

ROC Plot for classification models

SQL_ClearTable *SQL_ClearTable*

Description

SQL_ClearTable remove all rows from a database table

Usage

```
SQL_ClearTable(
  DBConnection,
  SQLTableName = "",
  CloseChannel = TRUE,
  Errors = TRUE
)
```

Arguments

DBConnection	RemixAutoML::SQL_Server_DBConnection()
SQLTableName	The SQL statement you want to run
CloseChannel	TRUE to close when done, FALSE to leave the channel open
Errors	Set to TRUE to halt, FALSE to return -1 in cases of errors

Author(s)

Adrian Antico

See Also

Other Database: AutoDataDictionaries(), SQL_DropTable(), SQL_Query_Push(), SQL_Query(), SQL_SaveTable(), SQL_Server_DBConnection()

SQL_DropTable *SQL_DropTable*

Description

SQL_DropTable drop a database table

Usage

```
SQL_DropTable(
  DBConnection,
  SQLTableName = "",
  CloseChannel = TRUE,
  Errors = TRUE
)
```

Arguments

DBConnection	RemixAutoML::SQL_Server_DBConnection()
SQLTableName	The SQL statement you want to run
CloseChannel	TRUE to close when done, FALSE to leave the channel open
Errors	Set to TRUE to halt, FALSE to return -1 in cases of errors

Author(s)

Adrian Antico

See Also

Other Database: AutoDataDictionaries(), SQL_ClearTable(), SQL_Query_Push(), SQL_Query(), SQL_SaveTable(), SQL_Server_DBConnection()

SQL_Query *SQL_Query*

Description

SQL_Query get data from a database table

Usage

```
SQL_Query(
  DBConnection,
  Query,
  ASIS = FALSE,
  CloseChannel = TRUE,
  RowsPerBatch = 1024
)
```

Arguments

`DBConnection`	RemixAutoML::SQL_Server_DBConnection()
`Query`	The SQL statement you want to run
`ASIS`	Auto column typing
`CloseChannel`	TRUE to close when done, FALSE to leave the channel open
`RowsPerBatch`	Rows default is 1024

`SQL_Query_Push` *SQL_Query_Push*

Description

SQL_Query_Push push data to a database table

Usage

```
SQL_Query_Push(DBConnection, Query, CloseChannel = TRUE)
```

Arguments

`DBConnection`	RemixAutoML::SQL_Server_DBConnection()
`Query`	The SQL statement you want to run
`CloseChannel`	TRUE to close when done, FALSE to leave the channel open

Author(s)

Adrian Antico

See Also

Other Database: `AutoDataDictionaries()`, `SQL_ClearTable()`, `SQL_DropTable()`, `SQL_Query()`, `SQL_SaveTable()`, `SQL_Server_DBConnection()`

SQL_SaveTable *SQL_SaveTable*

Description

SQL_SaveTable create a database table

Usage

```
SQL_SaveTable(
  DataToPush,
  DBConnection,
  SQLTableName = "",
  RowNames = NULL,
  ColNames = TRUE,
  CloseChannel = TRUE,
  AppendData = FALSE,
  AddPK = TRUE,
  Safer = TRUE
)
```

Arguments

DataToPush	data to be sent to warehouse
DBConnection	RemixAutoML::SQL_Server_DBConnection()
SQLTableName	The SQL statement you want to run
RowNames	c("Segment","Date")
ColNames	Column names in first row
CloseChannel	TRUE to close when done, FALSE to leave the channel open
AppendData	TRUE or FALSE
AddPK	Add a PK column to table
Safer	TRUE

Adrian Antico

See Also

Other Database: AutoDataDictionaries(), SQL_ClearTable(), SQL_DropTable(), SQL_Query_Push(), SQL_Query(), SQL_Server_DBConnection()

`SQL_Server_DBConnection` *SQL_Server_DBConnection*

Description

SQL_Server_DBConnection makes a connection to a sql server database

Usage

```
SQL_Server_DBConnection(DataBaseName = "", Server = "")
```

Arguments

`DataBaseName`	Name of the database
`Server`	Name of the server to use

Author(s)

Adrian Antico

See Also

Other Database: `AutoDataDictionaries()`, `SQL_ClearTable()`, `SQL_DropTable()`, `SQL_Query_Push()`, `SQL_Query()`, `SQL_SaveTable()`

`threshOptim` *threshOptim*

Description

threshOptim will return the utility maximizing threshold for future predictions along with the data generated to estimate the threshold

Usage

```
threshOptim(
  data,
  actTar = "target",
  predTar = "p1",
  tpProfit = 0,
  tnProfit = 0,
  fpProfit = -1,
  fnProfit = -2,
  MinThresh = 0.001,
  MaxThresh = 0.999,
  ThresholdPrecision = 0.001
)
```

Arguments

data	data is the data table you are building the modeling on
actTar	The column name where the actual target variable is located (in binary form)
predTar	The column name where the predicted values are located
tpProfit	This is the utility for generating a true positive prediction
tnProfit	This is the utility for generating a true negative prediction
fpProfit	This is the cost of generating a false positive prediction
fnProfit	This is the cost of generating a false negative prediction
MinThresh	Minimum value to consider for model threshold
MaxThresh	Maximum value to consider for model threshold
ThresholdPrecision	Incrementing value in search

Value

Optimal threshold and corresponding utilities for the range of thresholds tested

Author(s)

Adrian Antico

## End(Not run)
```

TimeSeriesDataPrepare *TimeSeriesDataPrepare*

Description

TimeSeriesDataPrepare is a function that takes raw data and returns the necessary time series data and objects for model building. It also fills any time gaps with zeros. Use this before you run any time series model functions.

Usage

```
TimeSeriesDataPrepare(
  data,
  TargetName,
  DateName,
  Lags,
  SeasonalLags,
  MovingAverages,
  SeasonalMovingAverages,
  TimeUnit,
  FCPeriods,
  HoldOutPeriods,
  TSClean = TRUE,
  ModelFreq = TRUE,
  FinalBuild = FALSE
)
```

Arguments

`data`	Source data.table for forecasting
`TargetName`	Name of your target variable
`DateName`	Name of your date variable
`Lags`	The max number of lags you want to test
`SeasonalLags`	The max number of seasonal lags you want to test
`MovingAverages`	The max number of moving average terms
`SeasonalMovingAverages`	The max number of seasonal moving average terms
`TimeUnit`	The level of aggregation your dataset comes in. Choices include: 1Min, 5Min, 10Min, 15Min, and 30Min, hour, day, week, month, quarter, year
`FCPeriods`	The number of forecast periods you want to have forecasted
`HoldOutPeriods`	The number of holdout samples to compare models against
`TSClean`	TRUE or FALSE. TRUE will kick off a time series cleaning operation. Outliers will be smoothed and imputation will be conducted.
`ModelFreq`	TRUE or FALSE. TRUE will enable a model-based time frequency calculation for an alternative frequency value to test models on.
`FinalBuild`	Set to TRUE to create data sets with full data

Value

Time series data sets to pass onto auto modeling functions

Author(s)

Adrian Antico

Examples

```
## Not run:
data <- data.table::fread(
  file.path(PathNormalizer(
    "C:\\Users\\aantico\\Documents\\Package\\data"),
    "tsdata.csv"))
TimeSeriesDataPrepare(
  data = data,
  TargetName = "Weekly_Sales",
  DateName = "Date",
  Lags = 5,
  MovingAverages,
  SeasonalMovingAverages,
  SeasonalLags = 1,
  TimeUnit = "week",
  FCPeriods = 10,
  HoldOutPeriods = 10,
  TSClean = TRUE,
  ModelFreq = TRUE,
  FinalBuild = FALSE)

## End(Not run)
```

TimeSeriesFill *TimeSeriesFill*

Description

TimeSeriesFill For Completing Time Series Data For Single Series or Time Series by Group

Usage

```
TimeSeriesFill(
  data = data,
  DateColumnName = "Date",
  GroupVariables = c("Store", "Dept"),
  TimeUnit = "weeks",
  FillType = c("maxmax", "minmax", "maxmin", "minmin"),
  MaxMissingPercent = 0.05,
  SimpleImpute = FALSE
)
```

Arguments

data	Supply your full series data set here
DateColumnName	Supply the name of your date column
GroupVariables	Supply the column names of your group variables. E.g. "Group" or c("Group1","Group2")
TimeUnit	Choose from "second", "minute", "hour", "day", "week", "month", "quarter", "year"
FillType	Choose from maxmax - Fill from the absolute min date to the absolute max date, minmax - Fill from the max date of the min set to the absolute max date, maxmin - Fill from the absolute min date to the min of the max dates, or minmin - Fill from the max date of the min dates to the min date of the max dates
MaxMissingPercent	The maximum amount of missing values an individual series can have to remain and be imputed. Otherwise, they are discarded.
SimpleImpute	Set to TRUE or FALSE. With TRUE numeric cols will fill NAs with a -1 and non-numeric cols with a "0"

Value

Returns a data table with missing time series records filled (currently just zeros)
