# Package 'RemixAutoML'

April 15, 2019

Title Remix Automated Machine Learning

Version 1.0.1
<b>Description</b> Automate and ensure high quality output for most of your machine learning and data science tasks. We have high quality functions that run at efficient speed with minimal memory constraints. The library contains functions for supervised learning, unsupervised learning, feature engineering, model evaluation and interpretation, along with some helper functions for graphing.

AutoH2OModeler

 $An\ Automated\ Machine\ Learning\ Framework\ using\ H2O$ 

### Description

Steps in the function include: See details below for information on using this function.

### Usage

```
AutoH2OModeler(Construct, max_memory, ratios, BL_Trees, nthreads,
  model_path, MaxRuntimeSeconds = 3600, MaxModels = 30,
  TrainData = NULL, TestData = NULL)
```

### Arguments

Construct	Core instruction file for automation (see Details below for more information on this)
max_memory	The ceiling amount of memory H2O will utilize
ratios	The percentage of train samples from source data (remainder goes to validation set)
BL_Trees	The number of trees to build in baseline GBM or RandomForest
nthreads	Set the number of threads to run function

model\_path Directory path for where you want your models saved

MaxRuntimeSeconds

Number of seconds of run time for grid tuning

MaxModels Number of models you'd like to have returned

TrainData Set to NULL or supply a data.table for training data

TestData Set to NULL or supply a data.table for validation data

#### **Details**

1. Logic: Error checking in the modeling arguments from your Construction file

2. ML: Build grid-tuned models and baseline models for comparison and checks which one performs better on validation data

3. Evaluation: Collects the performance metrics for both

4. Evaluation: Generates calibration plots (and boxplots for regression) for the winning model

5. Evaluation: Generates partial dependence calibration plots (and boxplots for regression) for the winning model

6. Evaluation: Generates variable importance tables and a table of non-important features

7. Production: Creates a storage file containing: model name, model path, grid tune performance, baseline performance, and threshold (if classification) and stores that file in your model\_path location

The Construct file must be a data table and the columns need to be in the correct order (see examples). Character columns must be converted to type "Factor". You must remove date columns or convert them to "Factor". For classification models, your target variable needs to be a (0,1) of type "Factor." See the examples below for help with setting up the Construct file for various modeling target variable types. There are examples for regression, classification, multinomial, and quantile regression. For help on which parameters to use, look up the r/h2o documentation. If you misspecify the construct file, it will produce an error and outputfile of what was wrong and suggestions for fixing the error.

Let's go over the construct file, column by column. The Targets column is where you specify the column number of your target variable (in quotes, e.g. "c(1)").

The Distribution column is where you specify the distribution type for the modeling task. For classification use bernoulli, for multilabel use multinomial, for quantile use quantile, and for regression, you can choose from the list available in the H2O docs, such as gaussian, poisson, gamma, etc. It's not set up to handle tweedie distributions currently but I can add support if there is demand.

The Loss column tells H2O which metric to use for the loss metrics. For regression, I typically use "mse", quantile regression, "mae", classification "auc", and multinomial "logloss". For deeplearning models, you need to use "quadratic", "absolute", and "crossentropy".

The Quantile column tells H2O which quantile to use for quantile regression (in decimal form).

The ModelName column is the name you wish to give your model as a prefix.

The Algorithm column is the model you wish to use: gbm, randomForest, deeplearning, AutoML, XGBoost, LightGBM.

The dataName column is the name of your data.

The TargetCol column is the column number of your target variable.

The FeatureCols column is the column numbers of your features.

The CreateDate column is for tracking your model build dates.

The GridTune column is a TRUE / FALSE column for whether you want to run a grid tune model for comparison.

The ExportValidData column is a TRUE / FALSE column indicating if you want to export the validation data.

The ParDep column is where you put the number of partial dependence calibration plots you wish to generate.

The PD\_Data column is where you specify if you want to generate the partial dependence plots on "All" data, "Validate" data, or "Train" data.

The ThreshType column is for classification models. You can specify "f1", "f2", "f0point5", or "CS" for cost sentitive.

The FSC column is the feature selection column. Specify the percentage importance cutoff to create a table of "unimportant" features.

The tpProfit column is for when you specify "CS" in the ThreshType column. This is your true positive profit.

The tnProfit column is for when you specify "CS" in the ThreshType column. This is your true negative profit.

The fpProfit column is for when you specify "CS" in the ThreshType column. This is your false positive profit.

The fnProfit column is for when you specify "CS" in the ThreshType column. This is your false negative profit.

The SaveModel column is a TRUE / FALSE indicator. If you are just testing out models, set this to FALSE.

The SaveModelType column is where you specify if you want a "standard" model object saved or a "mojo" model object saved.

The PredsAllData column is a TRUE / FALSE column. Set to TRUE if you want all the predicted values returns (for all data).

The TargetEncoding column let's you specify the column number of features you wish to run target encoding on. Set to NA to not run this feature.

The SupplyData column lets you supply the data names for training and validation data. Set to NULL if you want the data partitioning to be done internally.

#### Value

Returns saved models, corrected Construct file, variable importance tables, evaluation and partial dependence calibration plots, model performance measure, and a file called grid\_tuned\_paths.Rdata which contains paths to your saved models for operationalization.

AutoH2OScoring

AutoH2OScoring is the complement of AutoH20Modeler.

### Description

AutoH2OScoring is the complement of AutoH20Modeler. Use this for scoring models. You can score regression, quantile regression, classification, multinomial, clustering, and text models (built with the Word2VecModel function). You can also use this to score multioutcome models so long as the there are two models: one for predicting the count of outcomes (a count outcome in character form) and a multinomial model on the label data. You will want to ensure you have a record for each label in your training data in (0,1) as factor form.

10 AutoH2OScoring

#### Usage

```
AutoH2OScoring(Features = data, GridTuneRow = c(1:3),
  ScoreMethod = "Standard", TargetType = rep("multinomial", 3),
  ClassVals = rep("probs", 3), NThreads = 6, MaxMem = "28G",
  JavaOptions = "-Xmx1g -XX:ReservedCodeCacheSize=256m",
  FilesPath = getwd(), H2OShutDown = rep(FALSE, 3))
```

#### Arguments

Features This is a data.table of features for scoring.

GridTuneRow Numeric. The row numbers of grid\_tuned\_paths, KMeansModelFile, or

StoreFile containing the model you wish to score

ScoreMethod "Standard" or "Mojo": Mojo is available for supervised models; use stan-

dard for all others

TargetType "Regression", "Classification", "Multinomial", "MultiOutcome", "Text",

"Clustering". MultiOutcome must be two multinomial models, a count model (the count of outcomes, as a character value), and the multinomial

model predicting the labels.

ClassVals Choose from "p1", "Probs", "Label", or "All" for classification and multi-

nomial models.

NThreads Number of available threads for H2O

MaxMem Amount of memory to dedicate to H2O

JavaOptions Modify to your machine if the default doesn't work

FilesPath Set this to the folder where your models and model files are saved

H20ShutDown TRUE to shutdown H2O after the run. Use FALSE if you will be repeat-

edly scoring and shutdown somewhere else in your environment.

#### Value

Returns a list of predicted values. Each list element contains the predicted values from a single model predict call.

AutoH2OTextPrepScoring

AutoH2OTextPrepScoring is for NLP scoring

#### Description

This function returns prepared tokenized data for H2O Word2VecModeler scoring

### Usage

AutoH2OTextPrepScoring(data, string, MaxMem, NThreads)

### Arguments

data The text data

string The name of the string column to prepare

MaxMem Amount of memory you want to let H2O utilize

NThreads The number of threads you want to let H2O utilize

### Author(s)

Adrian Antico

#### See Also

AutoKMeans 13

AutoKMeans	AutoKMeans	Automated	row o	clustering	for	mixed	column	types
------------	------------	-----------	-------	------------	-----	-------	--------	-------

#### Description

AutoKMeans adds a column to your original data with a cluster number identifier. Uses glrm (grid tune-able) and then k-means to find optimal k.

#### Usage

```
AutoKMeans(data, nthreads = 4, MaxMem = "14G", SaveModels = NULL, PathFile = getwd(), GridTuneGLRM = TRUE, GridTuneKMeans = TRUE, glrmCols = c(1:5), IgnoreConstCols = TRUE, glrmFactors = 5, Loss = "Absolute", glrmMaxIters = 1000, SVDMethod = "Randomized", MaxRunTimeSecs = 3600, KMeansK = 50, KMeansMetric = "totss")
```

### Arguments

data is the source time series data.table

nthreads set based on number of threads your machine has available

MaxMem set based on the amount of memory your machine has available

SaveModels Set to "standard", "mojo", or NULL (default)

PathFile Set to folder where you will keep the models

GridTuneGLRM If you want to grid tune the glrm model, set to TRUE, FALSE otherwise GridTuneKMeans If you want to grid tuen the KMeans model, set to TRUE, FALSE other-

wise

glrmCols the column numbers for the glrm

 ${\tt IgnoreConstCols}$ 

tell H2O to ignore any columns that have zero variance

glrmFactors similar to the number of factors to return from PCA

Loss set to one of "Quadratic", "Absolute", "Huber", "Poisson", "Hinge", "Lo-

gistic", "Periodic"

glrmMaxIters max number of iterations

SVDMethod choose from "Randomized", "GramSVD", "Power"

MaxRunTimeSecs set the timeout for max run time

KMeansK number of factors to test out in k-means to find the optimal number

 $\label{eq:KMeansMetric} \textbf{KMeansMetric} \qquad pick the metric to identify top model in grid tune } c("totss", "betweenss", "withinss")$ 

#### Value

Original data.table with added column with cluster number identifier

AutoNLS

AutoNLS is a function for automatically building nls models

### Description

This function will build models for 9 different nls models, along with a non-parametric monotonic regression and a polynomial regression. The models are evaluated, a winner is picked, and the predicted values are stored in your data table.

### Usage

```
AutoNLS(data, y, x, monotonic = TRUE)
```

AutoNLS 15

#### Arguments

data
Data is the data table you are building the modeling on

Y is the target variable name in quotes

X X is the independent variable name in quotes

This is a TRUE/FALSE indicator - choose TRUE if you want monotonic

regression over polynomial regression

#### Value

A list containing "PredictionData" which is a data table with your original column replaced by the nls model predictions; "ModelName" the model name; "ModelObject" The winning model to later use; "EvaluationMetrics" Model metrics for models with ability to build.

AutoRecommender

Automatically build the best recommendere model among models available.

### Description

This function returns the winning model that you pass onto AutoRecommenderScoring

#### Usage

```
AutoRecommender(data, Partition = "Split", KFolds = 2, Ratio = 0.75,
RatingType = "TopN", RatingsKeep = 20,
SkipModels = "AssociationRules", ModelMetric = "TPR")
```

### Arguments

data This is your BinaryRatingsMatrix. See function RecomDataCreate

Partition Choose from "split", "cross-validation", "bootstrap". See evaluation-

Scheme in recommenderlab for details.

KFolds Choose 2 for traditional train and test. Choose greater than 2 for the

number of cross validations

Ratio The ratio for train and test. E.g. 0.75 for 75 percent data allocated to

 ${\rm training}$ 

RatingType Choose from "TopN", "ratings", "ratingMatrix"

RatingsKeep The total ratings you wish to return. Default is 20.

SkipModels AssociationRules runs the slowest and may crash your system. Choose

from: "AssociationRules", "ItemBasedCF", "UserBasedCF", "PopularItems", "RandomItems"

ModelMetric Choose from "Precision", "Recall", "TPR", or "FPR"

#### Value

The winning model used for scoring in the AutoRecommenderScoring function

### Author(s)

Adrian Antico and Douglas Pestana

#### See Also

Other Supervised Learning: AutoH2OModeler, AutoH2OScoring, AutoNLS, AutoRecommenderScoring, AutoTS

### Examples

### AutoRecommenderScoring

The AutoRecomScoring function scores recommender models from AutoRecommender()

#### Description

This function will take your ratings matrix and model and score your data in parallel.

### Usage

```
AutoRecommenderScoring(data, WinningModel, EntityColName = "CustomerID",
    ProductColName = "StockCode")
```

#### Arguments

data The binary ratings matrix from RecomDataCreate()
WinningModel The winning model returned from AutoRecommender()

EntityColName Typically your customer ID

ProductColName Something like "StockCode"

#### Value

Returns the prediction data

### Author(s)

AutoTS 19

AutoTS	AutoTS is an	automated i	time series	modelina	function
Macoro	11 000 1 D 00 011	automuta	correct ocrect	moucomy	jancoon

#### Description

Step 1 is to build all the models and evaluate them on the number of HoldOutPeriods periods you specify. Step 2 is to pick the winner and rebuild the winning model on the full data set. Step 3 is to generate forecasts with the final model for FCPeriods that you specify. AutoTS builds the best time series models for each type, using optimized box-cox transformations and using a user-supplied frequency for the ts data conversion along with a model-based frequency for the ts data conversion, compares all types, selects the winner, and generates a forecast. Models include:

#### Usage

```
AutoTS(data, TargetName = "Target", DateName = "DateTime",
  FCPeriods = 30, HoldOutPeriods = 30, TimeUnit = "day", Lags = 25,
  SLags = 2, NumCores = 4, SkipModels = NULL, StepWise = TRUE,
  TSClean = TRUE)
```

#### Arguments

data is the source time series data as a data.table - or a data structure that

can be converted to a data.table

TargetName is the name of the dependent variable in your data.table

DateName is the name of the date column in your data.table

FCPeriods is the number of periods into the future you wish to forecast

 ${\tt HoldOutPeriods}$  is the number of periods to use for validation testing

TimeUnit is the level of aggregation your dataset comes in

Lags is the number of lags you wish to test in various models (same as moving

averages)

SLags is the number of seasonal lags you wish to test in various models (same

as moving averages)

NumCores is the number of cores available on your computer

SkipModels Don't run specified models - e.g. exclude all models "DSHW" "ARFIMA"

"ARIMA" "ETS" "NNET" "TBATS" "TSLM"

StepWise Set to TRUE to have ARIMA and ARFIMA run a stepwise selection

process. Otherwise, all models will be generated in parallel execution,

but still run much slower.

TSClean Set to TRUE to have missing values interpolated and outliers replaced

with interpolated values: creates separate models for a larger comparison

set

20 AutoTS

#### Details

DSHW: Double Seasonal Holt Winters

ARFIMA: Auto Regressive Fractional Integrated Moving Average

ARIMIA: Stepwise Auto Regressive Integrated Moving Average with specified max lags, seasonal lags, moving averages, and seasonal moving averages

ETS: Additive and Multiplicitive Exponential Smoothing and Holt Winters

NNetar: Auto Regressive Neural Network models automatically compares models with 1 lag or 1 seasonal lag compared to models with up to N lags and N seasonal lags

TBATS: Exponential smoothing state space model with Box-Cox transformation, ARMA errors, Trend and Seasonal components

TSLM: Time Series Linear Model - builds a linear model with trend and season components extracted from the data

#### Value

Returns a list containing 1: A data.table object with a date column and the forecasted values; 2: The model evaluation results; 3: The champion model for later use if desired; 4: The name of the champion model.

AutoWord2VecModeler 21

AutoWord2VecModeler	Automated	word2vec	data	aeneration	via H2O

### Description

This function allows you to automatically build a word2vec model and merge the data onto your supplied dataset

#### Usage

```
AutoWord2VecModeler(data, stringCol = c("Text_Col1", "Text_Col2"),
  KeepStringCol = FALSE, model_path = getwd(), vects = 100,
  SaveStopWords = FALSE, MinWords = 1, WindowSize = 12,
  Epochs = 25, StopWords = NULL, SaveModel = "standard",
  Threads = 6, MaxMemory = "28G")
```

#### **Arguments**

data Source data table to merge vects onto

stringCol A string name for the column to convert via word2vec

KeepStringCol Set to TRUE if you want to keep the original string column that you

convert via word2vec

model\_path A string path to the location where you want the model and metadata

stored

vects The number of vectors to retain from the word2vec model

SaveStopWords Set to TRUE to save the stop words used

MinWords For H2O word2vec model
WindowSize For H2O word2vec model
Epochs For H2O word2vec model
StopWords For H2O word2vec model

SaveModel Set to "standard" to save normally; set to "mojo" to save as mojo. NOTE:

while you can save a mojo, I haven't figured out how to score it in the

AutoH20Scoring function.

Threads Number of available threads you want to dedicate to model building

MaxMemory Amount of memory you want to dedicate to model building

## End(Not run)
```

AutoWordFreq

Automated Word Frequency and Word Cloud Creation

### Description

This function builds a word frequency table and a word cloud. It prepares data, cleans text, and generates output.

#### Usage

```
AutoWordFreq(data, TextColName = "DESCR",
   GroupColName = "ClusterAllNoTarget", GroupLevel = 0,
   RemoveEnglishStopwords = TRUE, Stemming = TRUE,
   StopWords = c("bla", "bla2"))
```

### Arguments

data Source data table

 ${\tt TextColName} \qquad \text{A string name for the column}$ 

GroupColName Set to NULL to ignore, otherwise set to Cluster column name (or factor

column name)

GroupLevel Must be set if GroupColName is defined. Set to cluster ID (or factor

level)

 ${\tt RemoveEnglishStopwords}$ 

Set to TRUE to remove English stop words, FALSE to ignore

Stemming Set to TRUE to run stemming on your text data

StopWords Add your own stopwords, in vector format

### Examples

ChartTheme

Chart Theme function is a ggplot theme generator for ggplots

### Description

This function helps your ggplots look professional with the choice of the two main colors that will dominate the theme

### Usage

```
ChartTheme(Size = 12)
```

### Arguments

Size

The size of the axis labels and title

### Value

An object to pass along to ggplot objects following the "+" sign

DT\_GDL\_Feature\_Engineering

An Automated Feature Engineering Function Using data.table frollmean

### Description

Builds autoregressive and moving average from target columns and distributed lags and distributed moving average for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and moving averages. This function works for data with groups and without groups.

#### Usage

```
DT_GDL_Feature_Engineering(data, lags = c(seq(1, 50, 1)),
  periods = c(seq(5, 95, 5)), statsNames = c("MA"),
  targets = c("qty"), groupingVars = c("Group1", "Group2"),
  sortDateName = c("date"), timeDiffTarget = c("TimeDiffName"),
  timeAgg = c("days"), WindowingLag = 0, Type = c("Lag"),
  Timer = TRUE, SkipCols = NULL, SimpleImpute = TRUE)
```

### Arguments

data	A data.table you want to run the function on
lags	A numeric vector of the specific lags you want to have generated. You must include 1 if Windowing Lag $=$ 1.
periods	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
statsNames	A character vector of the corresponding names to create for the rollings stats variables.
targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
groupingVars	A character vector of categorical variable names you will build your lags and rolling stats by
sortDateName	The column name of your date column used to sort events over time
timeDiffTarget	Specify a desired name for features created for time between events. Set

to NULL if you don't want time between events features created.

timeAgg List the time aggregation level for the time between events features, such

as "hour", "day", "week", "month", "quarter", or "year"

WindowingLag Set to 0 to build rolling stats off of target columns directly or set to 1 to

build the rolling stats off of the lag-1 target

Type List either "Lag" if you want features built on historical values or "Lead"

if you want features built on future values

Timer Set to TRUE if you percentage complete tracker printout

SkipCols Defaults to NULL; otherwise supply a character vector of the names of

columns to skip

SimpleImpute Set to TRUE for factor level imputation of "0" and numeric imputation

of -1

#### Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

                                                   = 1,
                                    WindowingLag
                                                   = "Lag",
                                    Туре
                                                   = TRUE,
                                    Timer
                                    SkipCols
                                                   = FALSE,
                                    SimpleImpute = TRUE)
```

26 DummifyDT

Dumm	i	f١	רח,	
Dullilli	т	1 V	ו טי	

DummifyDT creates dummy variables for the selected columns.

### Description

DummifyDT creates dummy variables for the selected columns. Either one-hot encoding, N+1 columns for N levels, or N columns for N levels.

#### Usage

```
DummifyDT(data, cols, KeepFactorCols = FALSE, OneHot = TRUE,
   ClustScore = FALSE)
```

#### Arguments

data the data set to run the micro auc on

cols a vector with the names of the columns you wish to dichotomize

KeepFactorCols set to TRUE to keep the original columns used in the dichotomization

process

OneHot Set to TRUE to run one hot encoding, FALSE to generate N columns for

N levels

ClustScore This is for scoring AutoKMeans. Set to FALSE for all other applications.

#### Value

data table with new dummy variables columns and optionally removes base columns

### Author(s)

EvalPlot 27

ı	EvalPlot	$Function\ automatically\ builds\ calibration\ plots\ for\ model\ evaluation$	

#### Description

This function automatically builds calibration plots and calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

#### Usage

```
EvalPlot(data, PredictionColName = c("PredictedValues"),
  TargetColName = c("ActualValues"), GraphType = c("calibration"),
  PercentileBucket = 0.05, aggrfun = function(x) base::mean(x, na.rm = TRUE))
```

#### **Arguments**

data Data containing predicted values and actual values for comparison

PredictionColName

String representation of column name with predicted values from model

 ${\tt TargetColName} \quad {\tt String} \ {\tt representation} \ {\tt of} \ {\tt column} \ {\tt name} \ {\tt with} \ {\tt actual} \ {\tt values} \ {\tt from} \ {\tt model}$ 

GraphType Calibration or boxplot - calibration aggregated data based on summary

statistic; boxplot shows variation

PercentileBucket

Number of buckets to partition the space on (0,1) for evaluation

aggrfun The statistics function used in aggregation, listed as a function

#### Value

Calibration plot or boxplot

#### FAST\_GDL\_Feature\_Engineering

An Fast Automated Feature Engineering Function

### Description

For models with target variables within the realm of the current time frame but not too far back in time, this function creates autoregressive and rolling stats from target columns and distributed lags and distributed rolling stats for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and rolling stats. This function works for data with groups and without groups.

#### Usage

```
FAST_GDL_Feature_Engineering(data, lags = c(1:5), periods = c(seq(10, 50, 10)), statsFUNs = c("mean", "median", "sd", "quantile85", "quantile95"), statsNames = c("mean", "median", "sd", "quantile85", "quantile95"), targets = c("Target"), groupingVars = c("GroupVariable"), sortDateName = c("DateTime"), timeDiffTarget = NULL, timeAgg = c("hours"), WindowingLag = 1, Type = c("Lag"), Timer = FALSE, SkipCols = FALSE, SimpleImpute = TRUE, AscRowByGroup = c("temp"), RecordsKeep = 1)
```

#### Arguments

data	A data.table you want to run the function on
lags	A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag = 1.
periods	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
statsFUNs	Vector of functions for your rolling windows, such as mean, sd, min, max, quantile $$
statsNames	A character vector of the corresponding names to create for the rollings stats variables.
targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
groupingVars	A character vector of categorical variable names you will build your lags and rolling stats by
sortDateName	The column name of your date column used to sort events over time
timeDiffTarget	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.
timeAgg	List the time aggregation level for the time between events features, such as "hour", "day", "week", "month", "quarter", or "year"
WindowingLag	Set to 0 to build rolling stats off of target columns directly or set to 1 to build the rolling stats off of the lag-1 target
Туре	List either "Lag" if you want features built on historical values or "Lead"

if you want features built on future values

Timer Set to TRUE if you percentage complete tracker printout

SkipCols Defaults to NULL; otherwise supply a character vector of the names of

columns to skip

SimpleImpute Set to TRUE for factor level imputation of "0" and numeric imputation

of -1

AscRowByGroup Required to have a column with a Row Number by group (if grouping)

with 1 being the record for scoring (typically the most current in time)

RecordsKeep List the number of records to retain (1 for last record, 2 for last 2 records,

etc.)

#### Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

### Author(s)

Adrian Antico

GDL\_Feature\_Engineering

An Automated Feature Engineering Function

### Description

Builds autoregressive and rolling stats from target columns and distributed lags and distributed rolling stats for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and rolling stats. This function works for data with groups and without groups.

#### Usage

```
GDL_Feature_Engineering(data, lags = c(seq(1, 5, 1)), periods = c(3, 5, 10, 15, 20, 25), statsFUNs = c(function(x) quantile(x, probs = 0.1, na.rm = TRUE), function(x) quantile(x, probs = 0.9, na.rm = TRUE), function(x) base::mean(x, na.rm = TRUE), function(x) sd(x, na.rm = TRUE), function(x) quantile(x, probs = 0.25, na.rm = TRUE), function(x) quantile(x, probs = 0.75, na.rm = TRUE)), statsNames = c("q10", "q90", "mean", "sd", "q25", "q75"), targets = c("qty"), groupingVars = c("Group1", "Group2"), sortDateName = c("date"), timeDiffTarget = c("TimeDiffName"), timeAgg = c("days"), WindowingLag = 0, Type = c("Lag"), Timer = TRUE, SkipCols = NULL, SimpleImpute = TRUE)
```

### Arguments

data	A data.table you want to run the function on
lags	A numeric vector of the specific lags you want to have generated. You must include 1 if WindowingLag $= 1$ .
periods	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
statsFUNs	Vector that holds functions for your rolling stats, such as $function(x) mean(x)$ , $function(x) sd(x)$ , or $function(x)$ quantile(x)
statsNames	A character vector of the corresponding names to create for the rollings stats variables.
targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
groupingVars	A character vector of categorical variable names you will build your lags and rolling stats by
sortDateName	The column name of your date column used to sort events over time
timeDiffTarget	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.

timeAgg List the time aggregation level for the time between events features, such

as "hour", "day", "week", "month", "quarter", or "year"

WindowingLag Set to 0 to build rolling stats off of target columns directly or set to 1 to

build the rolling stats off of the lag-1 target

Type List either "Lag" if you want features built on historical values or "Lead"

if you want features built on future values

Timer Set to TRUE if you percentage complete tracker printout

SkipCols Defaults to NULL; otherwise supply a character vector of the names of

columns to skip

SimpleImpute Set to TRUE for factor level imputation of "0" and numeric imputation

of -1

#### Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

32 GenTSAnomVars

GenTSAnomVars	$GenTSAnomVars\ is\ an\ automated\ z\mbox{-}score\ anomaly\ detection\ via$
	GLM-like procedure

### Description

GenTSAnomVars is an automated z-score anomaly detection via GLM-like procedure. Data is z-scaled and grouped by factors and time periods to determine which points are above and below the control limits in a cumulative time fashion. Then a cumulative rate is created as the final variable. Set KeepAllCols to FALSE to utilize the intermediate features to create rolling stats from them. The anomalies are separated into those that are extreme on the positive end versus those that are on the negative end.

### Usage

```
GenTSAnomVars(data, ValueCol = "Value", GroupVar1 = "SKU",
  GroupVar2 = NULL, DateVar = "DATE", HighThreshold = 1.96,
  LowThreshold = -1.96, KeepAllCols = FALSE, IsDataScaled = TRUE)
```

#### Arguments

data the source residuals data.table

ValueCol the numeric column to run anomaly detection over

GroupVar1 this is a group by variable

GroupVar2 this is another group by variable

DateVar this is a time variable for grouping

HighThreshold this is the threshold on the high end

LowThreshold this is the threshold on the low end

KeepAllCols set to TRUE to remove the intermediate features

IsDataScaled set to TRUE if you already scaled your data

#### Value

The original data.table with the added columns merged in. When KeepAllCols is set to FALSE, you will get back two columns: AnomHighRate and AnomLowRate - these are the cumulative anomaly rates over time for when you get anomalies from above the thresholds (e.g. 1.96) and below the thresholds.

```

ModelDataPrep

Final Data Preparation Function

### Description

This function replaces inf values with NA, converts characters to factors, and imputes with constants

### Usage

```
ModelDataPrep(data, Impute = TRUE, CharToFactor = TRUE,
   MissFactor = "0", MissNum = -1)
```

#### **Arguments**

data This is your source data you'd like to modify

Impute Defaults to TRUE which tells the function to impute the data

CharToFactor Defaults to TRUE which tells the function to convert characters to factors

MissFactor Supply the value to impute missing factor levels

MissNum Supply the value to impute missing numeric values

#### Value

Returns the original data table with corrected values

### Examples

multiplot

Multiplot is a function for combining multiple plots

### Description

Sick of copying this one into your code? Well, not anymore.

#### Usage

```
multiplot(..., plotlist = NULL, cols = 2, layout = NULL)
```

### Arguments

... Passthrough arguments

plotlist This is the list of your charts

cols This is the number of columns in your multiplot

layout Leave NULL

#### Value

Multiple ggplots on a single image

ParDepCalPlots

 $Function\ automatically\ builds\ partial\ dependence\ calibration\ plots$ 

for model evaluation

### Description

This function automatically builds partial dependence calibration plots and partial dependence calibration boxplots for model evaluation using regression, quantile regression, and binary and multinomial classification

#### Usage

```
ParDepCalPlots(data, PredictionColName = c("PredictedValues"),
   TargetColName = c("ActualValues"),
   IndepVar = c("Independent_Variable_Name"),
   GraphType = c("calibration"), PercentileBucket = 0.05,
   FactLevels = 10, Function = function(x) base::mean(x, na.rm = TRUE))
```

#### Arguments

data Data containing predicted values and actual values for comparison

PredictionColName

Predicted values column names

TargetColName Target value column names

IndepVar Independent variable column names

GraphType calibration or boxplot - calibration aggregated data based on summary

statistic; boxplot shows variation

PercentileBucket

Number of buckets to partition the space on (0,1) for evaluation

FactLevels The number of levels to show on the chart (1. Levels are chosen based on

frequency; 2. all other levels grouped and labeled as "Other")

Function Supply the function you wish to use for aggregation.

### Value

Partial dependence calibration plot or boxplot

RecomDataCreate

Convert transactional data.table to a binary ratings matrix

### Description

Convert transactional data.table to a binary ratings matrix

### Usage

```
RecomDataCreate(data, EntityColName = "CustomerID",
    ProductColName = "StockCode", MetricColName = "TotalSales")
```

38 RedYellowGreen

#### Arguments

data This is your transactional data.table. Must include an Entity (typically

customer), ProductCode (such as SKU), and a sales metric (such as total

sales).

EntityColName This is the column name in quotes that represents the column name for

the Entity, such as customer

ProductColName This is the column name in quotes that represents the column name for

the product, such as SKU

MetricColName This is the column name in quotes that represents the column name for

the metric, such as total sales

#### Value

A BinaryRatingsMatrix

### Examples

RedYellowGreen

RedYellowGreen is for determining the optimal thresholds for binary classification when do-nothing is an option

### Description

This function will find the optimial thresholds for applying the main label and for finding the optimial range for doing nothing when you can quantity the cost of doing nothing

#### Usage

```
RedYellowGreen(data, PredictColNumber = 2, ActualColNumber = 1,
   TruePositiveCost = 0, TrueNegativeCost = 0,
   FalsePositiveCost = -10, FalseNegativeCost = -50, MidTierCost = -2,
   Cores = 8, Precision = 0.01)
```

RedYellowGreen 39

#### Arguments

data is the data table with your predicted and actual values from a clas-

sification model

PredictColNumber

The column number where the actual target variable is located (in binary

form)

ActualColNumber

The column number where the predicted values are located

TruePositiveCost

This is the utility for generating a true positive prediction

TrueNegativeCost

This is the utility for generating a true negative prediction

FalsePositiveCost

This is the cost of generating a false positive prediction

FalseNegativeCost

This is the cost of generating a false negative prediction

MidTierCost This is the cost of doing nothing (or whatever it means to not classify in

your case)

Cores Number of cores on your machine

Precision Set the decimal number to increment by between 0 and 1

#### Value

A data table with all evaluated strategies, parameters, and utilities, along with a 3d scatterplot of the results

ResidualOutliers

 $Residual Outliers \ is \ an \ automated \ time \ series \ outlier \ detection \\ function$ 

### Description

ResidualOutliers is an automated time series outlier detection function that utilizes tsoutliers and auto.arima. It looks for five types of outliers: "AO" Additive outliter - a singular extreme outlier that surrounding values aren't affected by; "IO" Innovational outlier - Initial outlier with subsequent anomalous values; "LS" Level shift - An initial outlier with subsequent observations being shifted by some constant on average; "TC" Transient change - initial outlier with lingering effects that dissapate exponentially over time; "SLS" Seasonal level shift - similar to level shift but on a seasonal scale.

ResidualOutliers 41

#### Usage

```
ResidualOutliers(data, DateColName = "DateTime",
   TargetColName = "Target", PredictedColName = NULL,
   TimeUnit = "day", maxN = 5, tstat = 2)
```

#### Arguments

data the source residuals data.table

DateColName The name of your data column to use in reference to the target variable

TargetColName The name of your target variable column

PredictedColName

The name of your predicted value. If you supply this, you will run anomaly detection of the difference between the target variable and your predicted value. If you leave PredictedColName NULL then you will run anomaly

detection over the target variable.

TimeUnit The time unit of your date column: hour, day, week, month, quarter, year maxN the largest lag or moving average (seasonal too) values for the arima fit

tstat the t-stat value for tsoutliers

#### Value

A named list containing FullData = original data.table with outliers data and ARIMA\_MODEL = the arima model.

Scoring\_GDL\_Feature\_Engineering

An Automated Scoring Feature Engineering Function

### Description

For scoring purposes (brings back a single row by group), this function creates autoregressive and rolling stats from target columns and distributed lags and distributed rolling stats for independent features distributed across time. On top of that, you can also create time between instances along with their associated lags and rolling stats. This function works for data with groups and without groups.

#### Usage

```
Scoring_GDL_Feature_Engineering(data, lags = c(seq(1, 5, 1)),
  periods = c(3, 5, 10, 15, 20, 25), statsFUNs = c(function(x) mean(x,
  na.rm = TRUE)), statsNames = c("MA"), targets = c("Target"),
  groupingVars = NULL, sortDateName = c("DateTime"),
  timeDiffTarget = c("Time_Gap"), timeAgg = "days", WindowingLag = 1,
  Type = "Lag", Timer = TRUE, SkipCols = FALSE,
  SimpleImpute = TRUE, AscRowByGroup = "temp", RecordsKeep = 1)
```

### Arguments

- 8		
	data	A data.table you want to run the function on
	lags	A numeric vector of the specific lags you want to have generated. You must include 1 if Windowing Lag $=$ 1.
	periods	A numeric vector of the specific rolling statistics window sizes you want to utilize in the calculations.
	statsFUNs	Vector of functions for your rolling windows, such as mean, sd, min, max, quantile $$
	statsNames	A character vector of the corresponding names to create for the rollings stats variables.
	targets	A character vector of the column names for the reference column in which you will build your lags and rolling stats
	groupingVars	A character vector of categorical variable names you will build your lags and rolling stats by
	sortDateName	The column name of your date column used to sort events over time
	timeDiffTarget	Specify a desired name for features created for time between events. Set to NULL if you don't want time between events features created.
	timeAgg	List the time aggregation level for the time between events features, such as "hour", "day", "week", "month", "quarter", or "year"
	WindowingLag	Set to 0 to build rolling stats off of target columns directly or set to 1 to build the rolling stats off of the lag-1 target

Type List either "Lag" if you want features built on historical values or "Lead"

if you want features built on future values

Timer Set to TRUE if you percentage complete tracker printout

SkipCols Defaults to NULL; otherwise supply a character vector of the names of

columns to skip

SimpleImpute Set to TRUE for factor level imputation of "0" and numeric imputation

of -1

AscRowByGroup Required to have a column with a Row Number by group (if grouping)

with 1 being the record for scoring (typically the most current in time)

RecordsKeep List the number of records to retain (1 for last record, 2 for last 2 records,

etc.)

#### Value

data.table of original data plus created lags, rolling stats, and time between event lags and rolling stats

#### Author(s)

Adrian Antico

44 tempDatesFun

SimpleCap

SimpleCap function is for capitalizing the first letter of words

### Description

SimpleCap function is for capitalizing the first letter of words (need I say more?)

### Usage

```
SimpleCap(x)
```

### Arguments

Χ

Column of interest

### Value

An object to pass along to ggplot objects following the "+" sign

### Author(s)

Adrian Antico

### See Also

 $Other\ Misc:\ AutoH20TextPrepScoring,\ AutoWordFreq,\ ChartTheme,\ PrintObjectsSize,\ RecomDataCreate,\ RemixTheme,\ multiplot,\ percRank,\ tempDatesFun,\ tokenizeH20$ 

### Examples

```
x <- "adrian"
x <- SimpleCap(x)</pre>
```

tempDatesFun

 $tempDatesFun\ Convert\ Excel\ datetime\ char\ columns\ to\ Date\ columns$ 

### Description

temp Dates<br/>Fun takes the Excel date<br/>time column, which imports as character, and converts it into a date type<br/>  $\,$ 

### Usage

```
tempDatesFun(x)
```

#### **Arguments**

Х

The column of interest

threshOptim 45

#### Value

An object to pass along to ggplot objects following the "+" sign

### Author(s)

Adrian Antico

#### See Also

 $Other\ Misc:\ AutoH20TextPrepScoring,\ AutoWordFreq,\ ChartTheme,\ PrintObjectsSize,\ RecomDataCreate,\ RemixTheme,\ SimpleCap,\ multiplot,\ percRank,\ tokenizeH20$ 

### Examples

```
## Not run:
Cdata[, DAY_DATE := tempDatesFun(DAY_DATE)]
Cdata[, DAY_DATE := base::as.Date(DAY_DATE, "%m/%d/%Y")]
## End(Not run)
```

threshOptim

Utility maximizing thresholds for binary classification

### Description

This function will return the utility maximizing threshold for future predictions along with the data generated to estimate the threshold

### Usage

```
threshOptim(data, actTar = "target", predTar = "p1", tpProfit = 0,
  tnProfit = 0, fpProfit = -1, fnProfit = -2)
```

### Arguments

data	data is the data table you are building the modeling on
actTar	The column name where the actual target variable is located (in binary form)
predTar	The column name where the predicted values are located
tpProfit	This is the utility for generating a true positive prediction
tnProfit	This is the utility for generating a true negative prediction
fpProfit	This is the cost of generating a false positive prediction
fnProfit	This is the cost of generating a false negative prediction

#### Value

Optimal threshold and corresponding utilities for the range of thresholds tested

### Examples

tokenizeH20

For NLP work

### Description

This function tokenizes text data

### Usage

tokenizeH2O(data)

### Arguments

data

The text data

### Author(s)

Adrian Antico
